# OpenShift Life Cycle Reminder

- Release Driven – function of the next release
- 3 Minor Releases are in play at any given time. (4 if you count the EUS release)
- OCP 4.6 will bump OCP 4.3 out of support.
- OCP 4.2 = 10 months of support
- OCP 4.3 = 10 months of support

OpenShift\_30\_0619

Specific to MAJOR Version (eg 4)

<https://access.redhat.com/support/policy/updates/openshift>

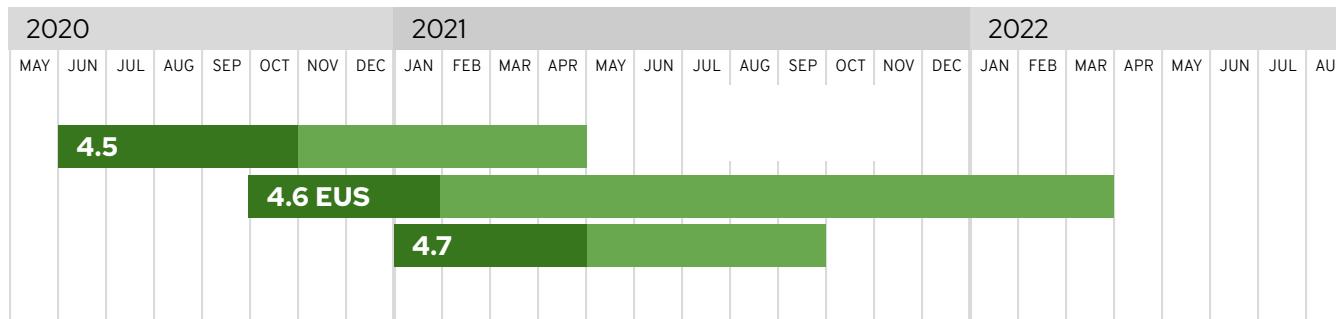

# OpenShift 4.6 EUS

## What is Extended Update Support (EUS) ?

- OCP with an extended timeframe for critical security and bug fixes
- Available to premium support customers
- Not available as an add-on for standard support

## Goals for the 4.6 EUS

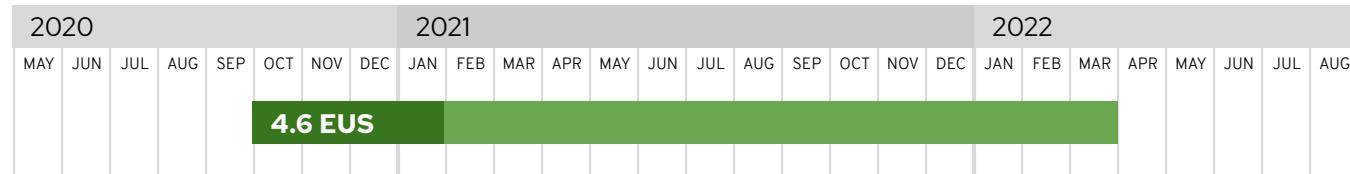

- Work within a customer's release management philosophies
- Provide an over-the-air pathway to update between EUS releases (currently serially)
  - Customer might align more to CAM or ACM
- Aligned with RHEL 8.2 EUS

■ N release  
Full support, RFEs, bugfixes, security

■ N-2 release  
OTA pathway to N release, critical bugs and security

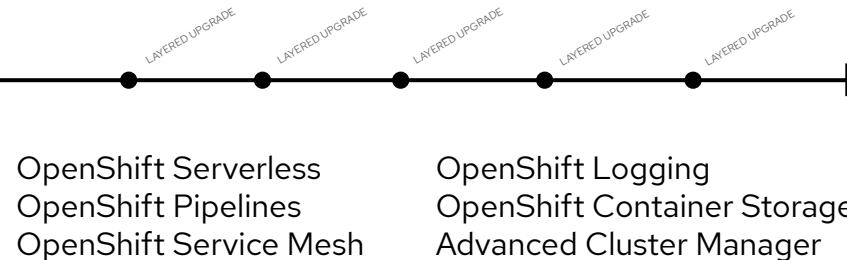

# OpenShift EUS and Layered Product and Add-ons

Duration of the Platform EUS

Add-ons have a version that  
is guaranteed to work for  
Platform EUS

# Kubernetes 1.19

## Control Plane & Security

- Automatically track and act on the features not making Stable
- Warning mechanism for use of deprecated APIs
- AppProtocol to Services and Endpoints
- Kubelet Client TLS Certificate bootstrap and rotation
- NodeRestriction admission controller

## Misc

- Structured Logging proposal

## Scheduling

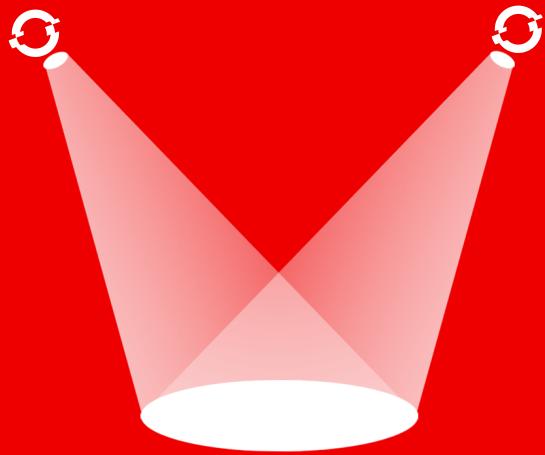

- Customize the behavior of the Kube-scheduler
- Scheduler Profiles
- Pod Topology Spread constraints

## Storage

- Immutable Secrets and ConfigMaps
- CSI Storage Capacity management (alpha)

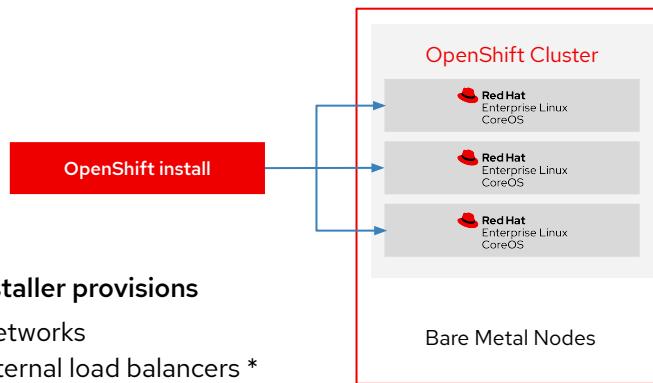

# OpenShift 4.6 Spotlight Features

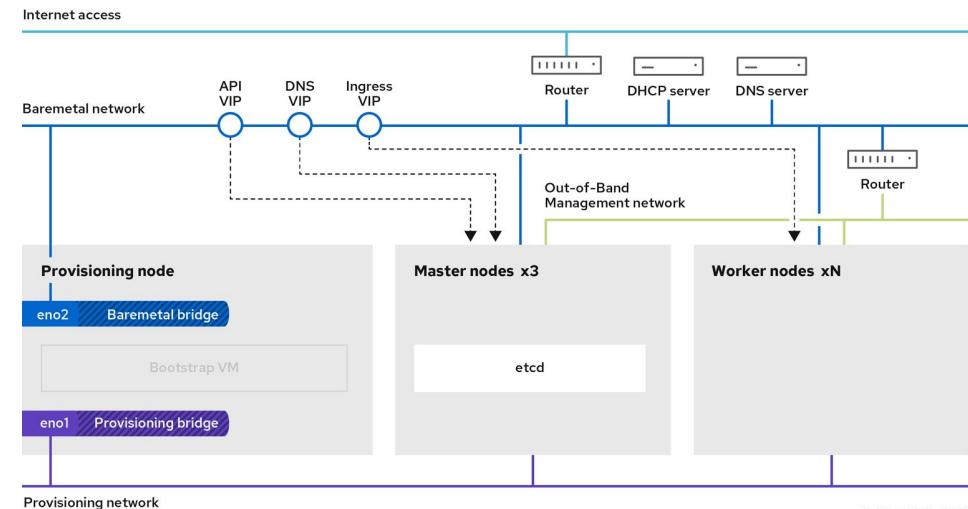

# Full stack automation (IPI) installation on Bare Metal

Deploying Red Hat OpenShift on Bare Metal on Installer-Provisioned Infrastructure (IPI)

## ► Installer provisions

- Networks
- Internal load balancers \*
- Internal DNS \*
- Red Hat CoreOS installation
- CoreOS ignition configs
- OpenShift nodes
- OpenShift cluster resources

# Full stack automation (IPI) installation on Bare Metal

Deploying Red Hat OpenShift on Bare Metal on Installer-Provisioned Infrastructure (IPI)

## Bare Metal Management

Powered by Metal<sup>3</sup> and OpenStack Ironic under the hood

## Host Power Management

Redfish, IPMI, iDrac, iLo.

## Provisioning over the network

Installation over DHCP/PXE or Virtual Media

## Disconnected Installations

RHCO image cache and disconnected registry

Metal<sup>3</sup>

OpenStack Ironic

# AWS GovCloud

## Deploy OpenShift to AWS GovCloud regions

- Government customers and their Partners can now deploy OpenShift to the AWS GovCloud 'US-East' & 'US-West' regions.
- AWS GovCloud (US) is specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other U.S. customers that need to run sensitive workloads in the cloud.
- RHEL CoreOS AMI publishing is not available in the GovCloud regions, so users must upload their own prior to installing OpenShift via:
  - 'aws ec2 import-snapshot' & 'aws ec2 register-image'
- Installation of OpenShift on AWS GovCloud is similar to existing deployment methods for other AWS regions, but the AWS region and RHEL CoreOS AMI ID must be manually configured in install-config.yaml.

```
% aws ec2 describe-regions --output text
REGIONS      ec2.us-gov-west-1.amazonaws.com      opt-in-not-required      us-gov-west-1
REGIONS      ec2.us-gov-east-1.amazonaws.com      opt-in-not-required      us-gov-east-1

% grep -B 1 -A 2 "aws:" mycluster/install-config.yaml
platform:
aws:
  region: us-gov-west-1
  amiID: ami-9dbf86fc

% ./openshift-install create cluster --dir mycluster
INFO Credentials loaded from default AWS environment variables

```

# Microsoft Azure Government (MAG)

## Deploy OpenShift to Microsoft Azure Government

- Government customers and their Partners can now deploy OpenShift to the Microsoft Azure Government (MAG) dedicated instance.
- MAG is comprised of six government-only datacenter regions, all granted an Impacted Level 5 Provisional Authorization.
- Installation of OpenShift to MAG is similar to existing deployment methods for other Azure regions, but the 'cloudName' field must be set to 'AzureUSGovernmentCloud' in the install-config.

```
% az cloud set --name AzureUSGovernment
Switched active cloud to 'AzureUSGovernment'.
Active subscription switched to 'Production (291bba3f-e0a5-47bc-a099-3bdcb2a50a05)'.

% az account list-locations -o table

Generally Available

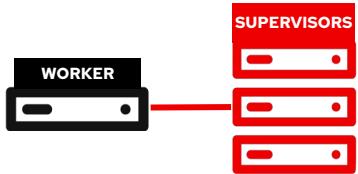

# OpenShift Update Service

## Update manager for your clusters in restricted or disconnected networks

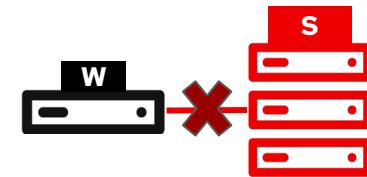

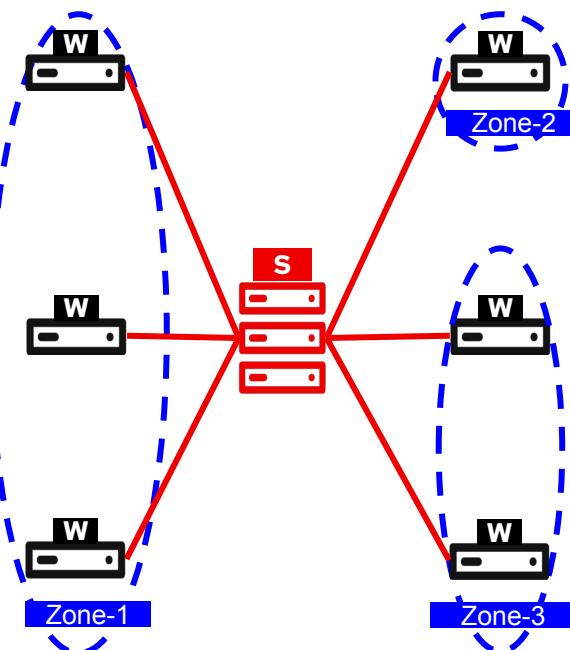

- OpenShift Update Service (OSUS) is the on-premise release of Red Hat's hosted update service
- Supports the publishing of upgrade graph information to clusters in restricted networks
- Provides clusters with a list of next recommended update versions based on the current version installed on the cluster
- Comprised of two services:
  - **Graph Builder:** Fetches OpenShift release payload information (primary metadata) from any container registry (compatible with [Docker registry V2 API](#)) and builds a [directed acyclic graph](#) (DAG) representing valid upgrade edges
  - **Policy Engine:** Responsible for selectively serving updates to every cluster by altering a client's view of the graph with a set of filters
- GA release planned for post-4.6 and will be distributed on Operator Hub as an optional add-on operator
- [Blog post announcing OpenShift Update Service](#) Generally Available

# Specifications for Remote Worker Nodes

Red Hat OpenShift Supervisors reside in a central location, with reliably-connected workers distributed at edge sites sharing a control plane.

## Tolerant of disruption

- Admin can configure status update frequency
- Zones with disruption budget
- Tolerations
- DaemonSet & Static Pods stay running

# Open Virtual Network (OVN)

**Goal:** Develop and support a modern, maintainable, community-based, open-source Kubernetes CNI network plugin for OpenShift that complements the existing capabilities of OVS to add native support for virtual network abstractions.

- Next-gen Kubernetes CNI plugin (ovn-kubernetes)
- OCP 4.6 GA (non-default, default TBD)
- Install-time option or post-install (bare metal only) migration

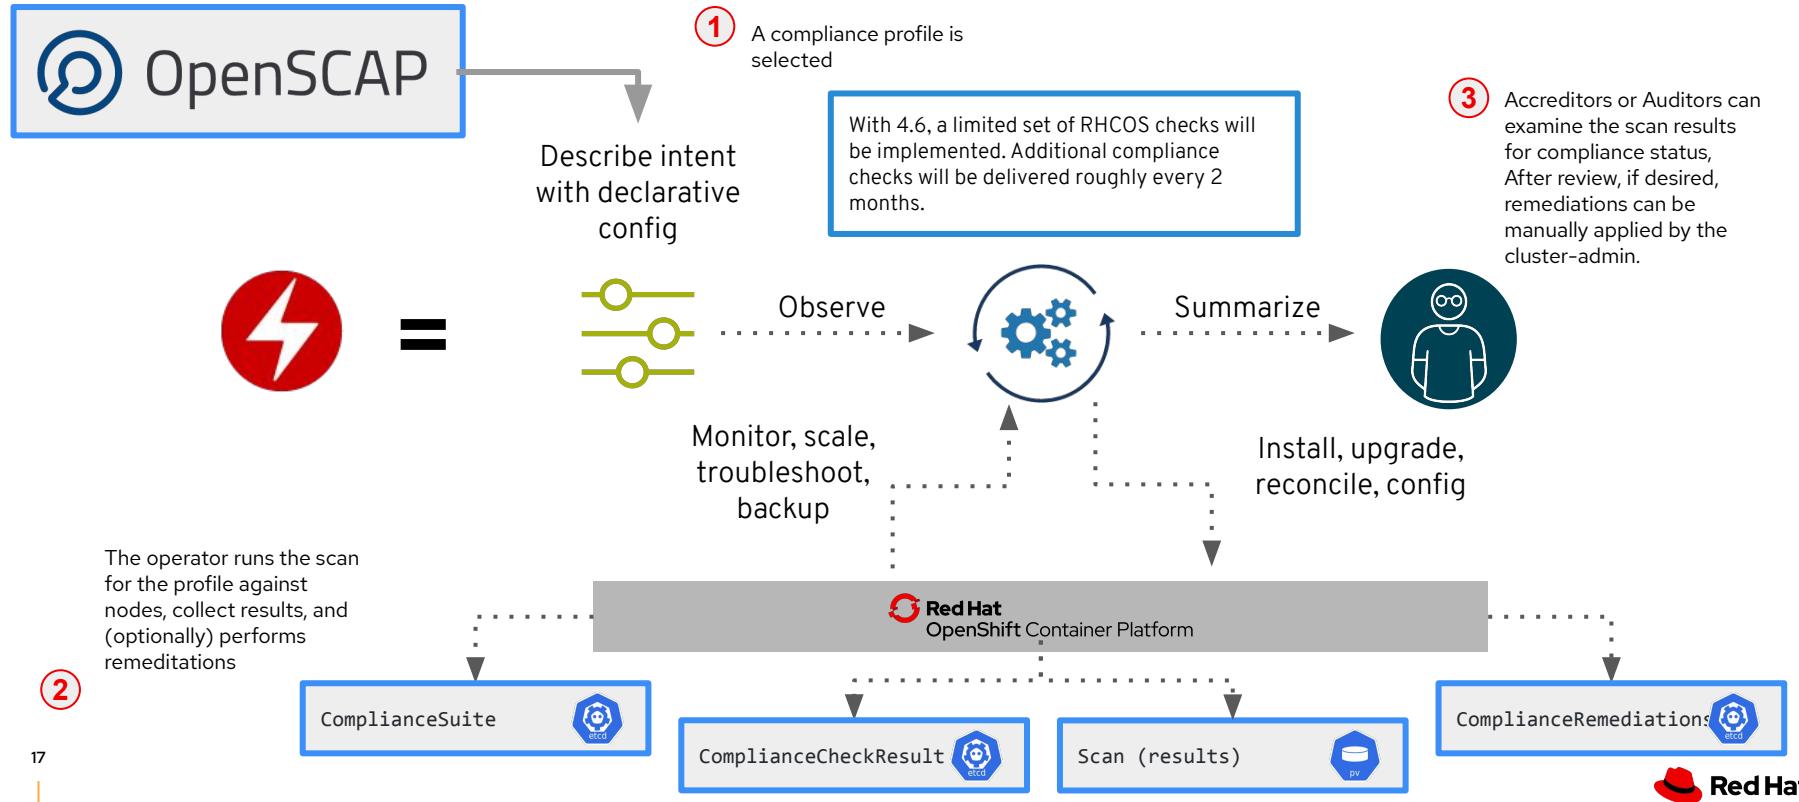

## Why?

- Consolidates Red Hat SDN efforts across products
- Advanced Telco and enterprise-grade features
- Flexible SDN architecture for faster feature development
- Large upstream community (Linux Foundation project)
- Red Hat leadership in upstream OVS & OVN communities
- Manages overlays and physical network connectivity
- Flexible security policies via ACLs and security groups
- Distributed L3 routing, L2/L3 Gateways to other networks
- IPv4 and IPv6 capability
- Integration with TOR and other "physical" gateways
- Native support for NAT, load balancing and IPAM
- Windows "Hybrid Overlay" service for pod-to-pod traffic between Windows and Linux cluster nodes.

## Technology Highlights Comparison

OpenShift SDN	OVN Kubernetes
veth pairs	veth pairs
OVS bridge	OVS bridge
Central controller / host-ipam	Central controller / host-ipam
VXLAN tunnels	Geneve tunnels
OVS flows for NetworkPolicy	OVS flows for NetworkPolicy
IPTables for services	OVN LBs for services
IPTables for NAT	OVS for NAT

# OpenShift Compliance Operator: Declarative Security Compliance

# Monitor your own services

## Generally Available

### Leverage our existing Monitoring infrastructure to monitor your own workloads.

- Enable a dedicated monitoring stack managed by us.
- Configure monitoring for your custom services or infrastructure services not covered by the out-of-the-box cluster monitoring stack.
- Access metrics and alert information through a single, multi-tenant interface.
  - **Note:** You can explore and manage both from the developer perspective inside the OpenShift Console.
- Not in scope for this release are things like adding your own dashboards to the console, creating new rules inside platform-specific namespaces (e.g. openshift-\*), tenant-based routing configuration for Alertmanager, and a few more.
- *Monitoring your sample application* **Quick Start** available to show users how to access basic monitoring features

1. Enable dedicated monitoring by setting 'enableUserWorkload' to 'true' inside the cluster-monitoring-config ConfigMap.

```
apiVersion: v1
kind: ConfigMap
metadata:
  name: cluster-monitoring-config
  namespace: openshift-monitoring
data:
  config.yaml: |
    enableUserWorkload: true
```

2. Configure a ServiceMonitor CR inside a user-defined namespace where app is running that exposes a /metrics endpoint.

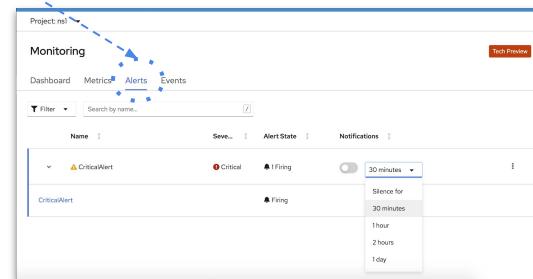

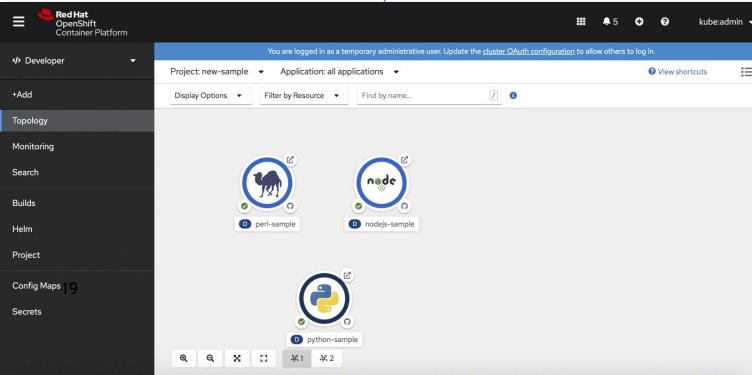

3. Go to the Developer Perspective, switch to your namespace and look for your metrics (it can take a bit time to have our infra picking up everything)

# Application Monitoring & Troubleshooting

*Generally Available*

## Monitor your applications with ease!

- Improved discoverability of alerts in topology and Monitoring
- Easy access to **Alert Details**
- **Alerts** tab allows users to view application alerts & silence them as needed
- *Monitoring your sample application* **Quick Start** available to show users how to access basic monitoring features

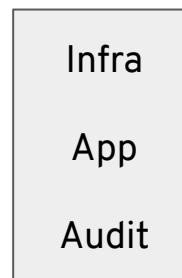

# Introduce new log forwarding API

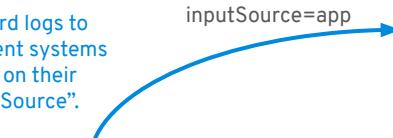

*Generally Available*

**Abstract Fluentd configuration by introduce new log forwarding API to improve support and experience for customers.**

- Introduce a new, cluster-wide *ClusterLogForwarder* CRD (API) that replaces needs to configure log forwarding via Fluentd ConfigMap.
- The API helps to reduce probability to misconfigure Fluentd and helps bringing in more stability into the Logging stack.
- Features include: Audit log collection and forwarding, Kafka support, namespace- and source-based routing, tagging, as well as improvements to the existing log forwarding features (e.g. syslog RFC5424 support).
- **WARNING:** We will not automagically migrate old Tech Preview CRs into a GA CR.

Forward logs to different systems based on their "inputSource".

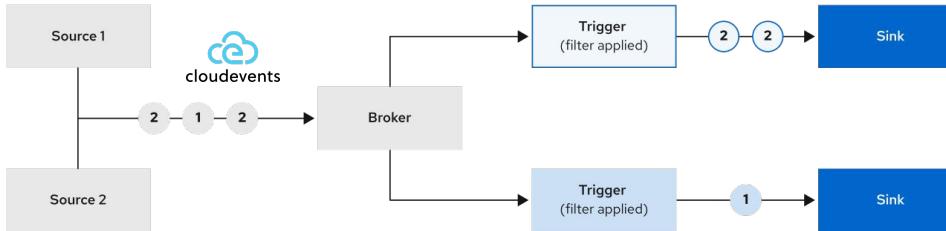

```
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogForwarder"
spec:
  outputs:
    - name: MyLogs
      type: Syslog
      syslog:
        Facility: Local0
        url: localstore.example.com:9200
  pipelines:
    - inputs: [Infrastructure, Application, Audit]
      outputs: [MyLogs]
```

# Eventing

Events

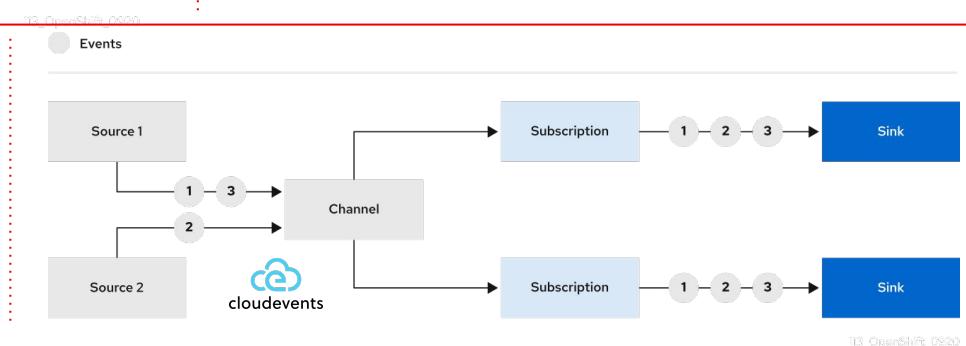

## ■ Brokers

- ✓ Built-in Event Filtering
- ✓ Routing based on event types or attributes
- ✓ Multiple event types
- ✓ Multi-tenant

## ■ Channels

- ✓ Event Fanout to multiple subscribers
- ✓ Same event type
- ✓ Single-tenant

13\_OpenShift\_0920

# Eventing User Experience

Coming with OpenShift Serverless 1.11

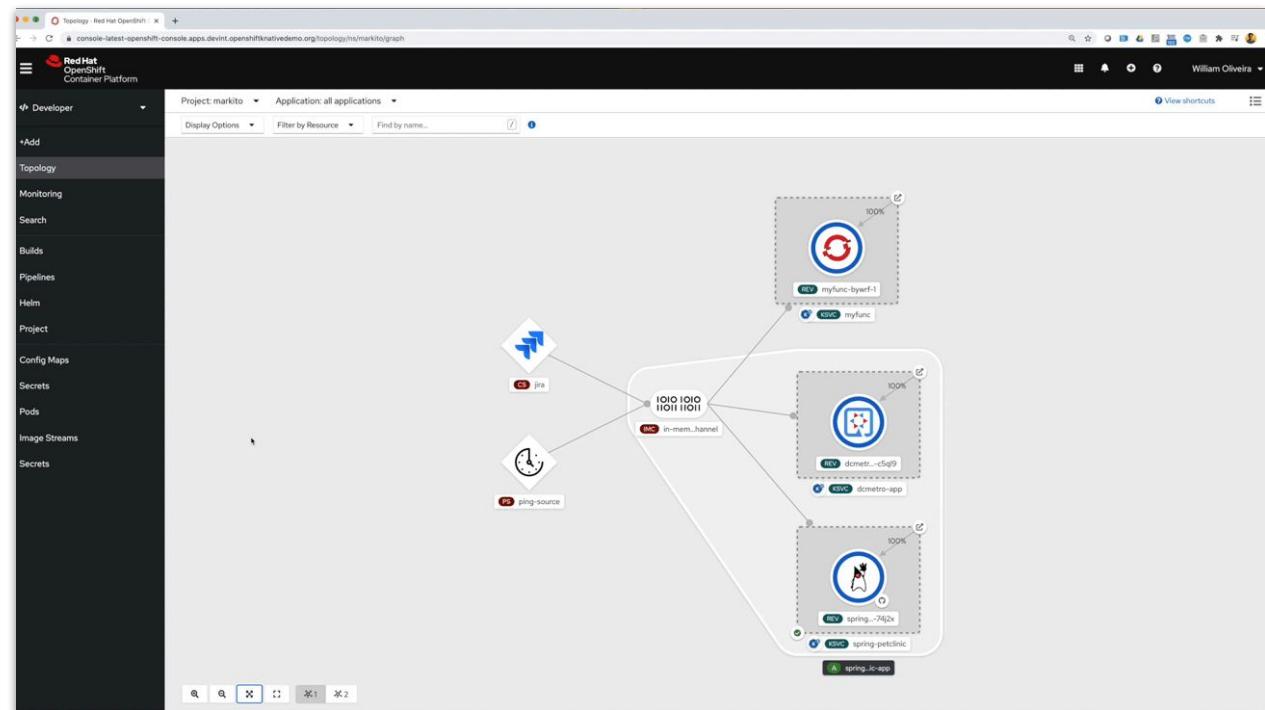

## Camel-K Connectors

- Connect your applications with AWS Kinesis, AWS SQS, Slack, JIRA, Telegram, SalesForce and more...

## Red Hat AMQ Streams

- Integration with Apache Kafka for reliable event delivery with Channels and Broker support.

**Red Hat**

# Advanced Cluster Management for Kubernetes

Robust. Proven. Award-winning.

# Red Hat Advanced Cluster Management for Kubernetes

## What's new with 2.1

The screenshot displays four main sections of the Red Hat Advanced Cluster Management for Kubernetes interface:

- Multi-cluster management:** Shows clusters from Google (1 cluster) and Amazon (2 clusters). It includes a summary table for applications, clusters, and Kubernetes types, and a cluster compliance section.
- Policy driven governance, risk, and compliance:** Shows governance and risk metrics (80/80 Cluster violations, 8/12 Policy violations) and a policy repository table.
- Advanced application lifecycle management:** Shows the creation of an application named "guestbook-app" with a GitHub repository URL (`https://github.com/openshift/book-import-test123.git`) and a detailed view of the application manifest.
- Observability:** Shows a resource topology diagram for the "guestbook-app" and a deployment status dashboard with metrics like Service health, Service availability, Deployment status, and Replace status.

### Multi-cluster lifecycle management

- GA provisioning of OpenShift on vSphere
- GA provisioning of OpenShift on Bare Metal

### Policy driven governance, risk, and compliance

- Open Source Policy Repository
- Enhanced OPA integration

### Advanced application lifecycle management

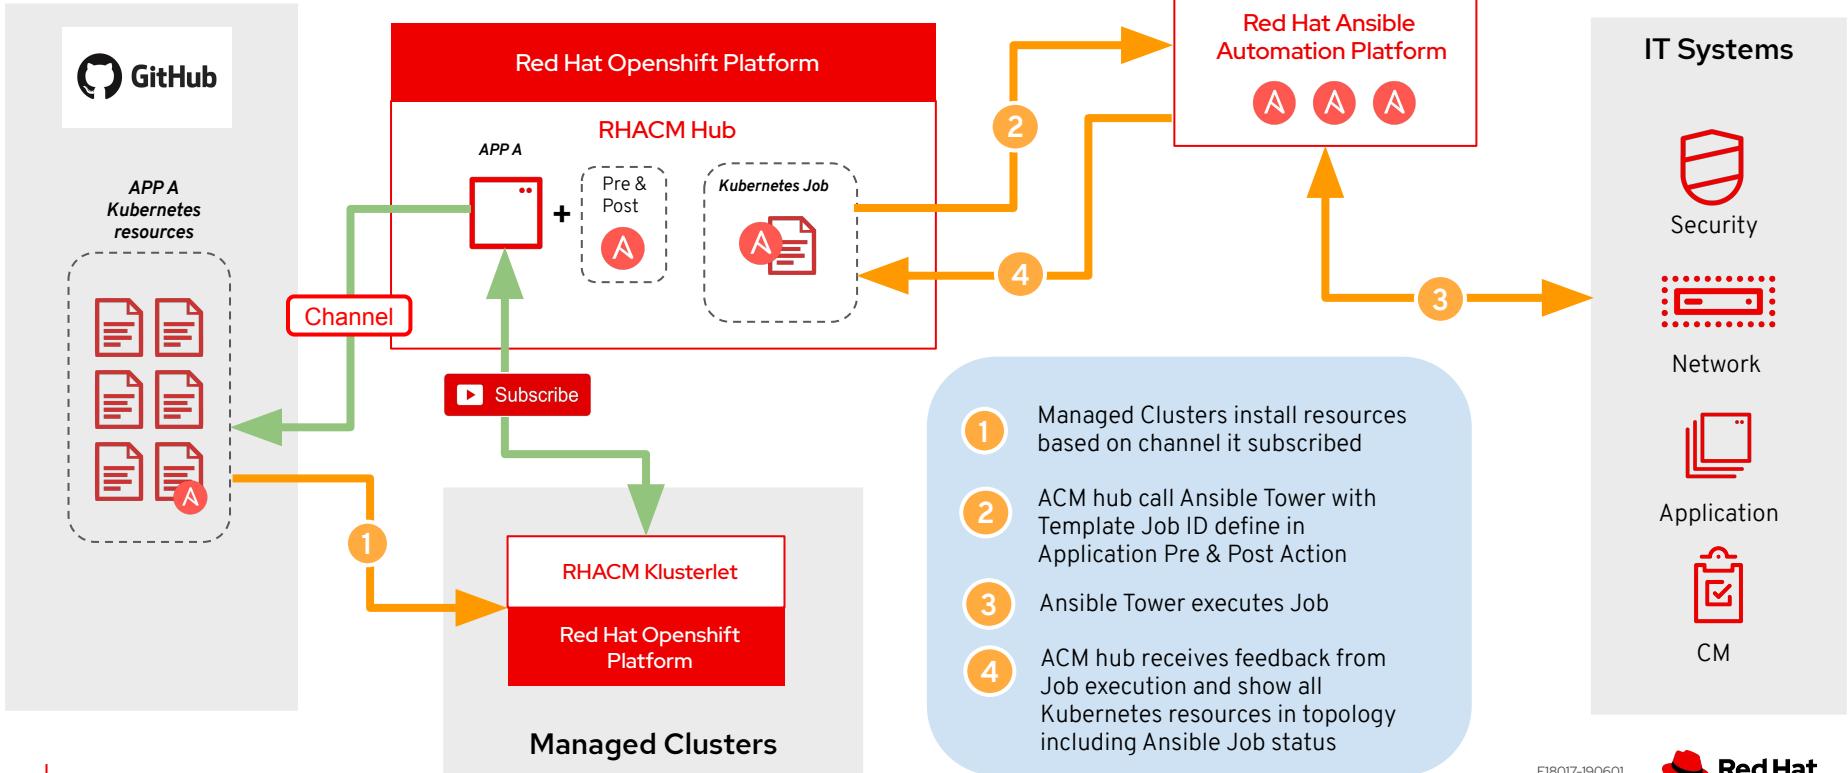

- Simplified Application Experience
- Portfolio Integration with Ansible Automation Platform - **Tech Preview**

### Observability for your Clusters and Apps

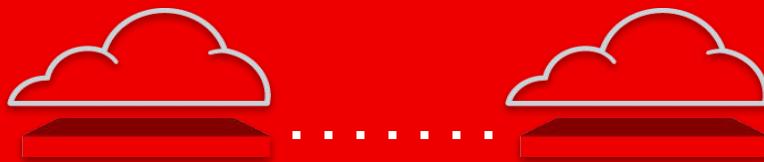

- Cluster Health monitoring with Thanos
- Multi-cluster health optimization with Grafana

# OpenShift Dedicated & Amazon Red Hat OpenShift

## New Feature Highlights

- UI for cluster upgrade scheduling
- Custom Machine Pools (AZ aware Machine Sets)
- Customer notifications tied to Cluster History Log
- BYOK Disk Encryption on AWS CCS

The screenshot displays two main components of the OpenShift Dedicated UI:

- Add machine pool dialog:** This modal window allows users to define a machine pool. It includes a search bar ("Something about adding a machine pool..."), a dropdown for "Instance type" (with options like "4 vCPU 32 GiB RAM General purpose m5.xlarge", "8 vCPU 32 GiB RAM General purpose m5.2xlarge", and "8 vCPU 32 GiB RAM General purpose m5.4xlarge"), and a dropdown for "Compute node count" set to 4.
- My Dedicated Cluster page:** This page shows the status of a cluster named "My Dedicated Cluster". It has tabs for Overview, Monitoring, Access control, Networking, Add ons, and Upgrade settings (which is currently selected). The Upgrade settings section contains the following details:
  - Maintenance window and upgrade strategy:** Set to "Sunday" at "01:00 UTC" and "Saturday 9:00 PM EDT (UTC-4)". A note says "Show equivalent in local time, with UTC offset indicated".
  - Upgrade strategy:** Set to "Automatic". A note states: "Clusters will be automatically upgraded within your defined maintenance window when new versions are available." An option for "Manual" is also present.
  - Note:** "High and Critical security concerns (CVEs) will be patched automatically within 48 hours, regardless of your chosen upgrade strategy."
  - Node draining:** A note: "You may set a grace period for each node's workloads to be moved during upgrades. After this grace period, any workloads that have not been successfully drained from a node will be forcibly shut down." A dropdown for "Node drain grace period" is set to "1 hour".
  - Upgrade status:** Shows "Upgrade available" for version 4.3.16, with a timeline indicating the upgrade is scheduled for 1 August 2020, 2:00 AM EDT (UTC-4).

# Azure Red Hat OpenShift

## Microsoft Azure Government (MAG)

- Deploy managed OpenShift clusters on Azure's government cloud

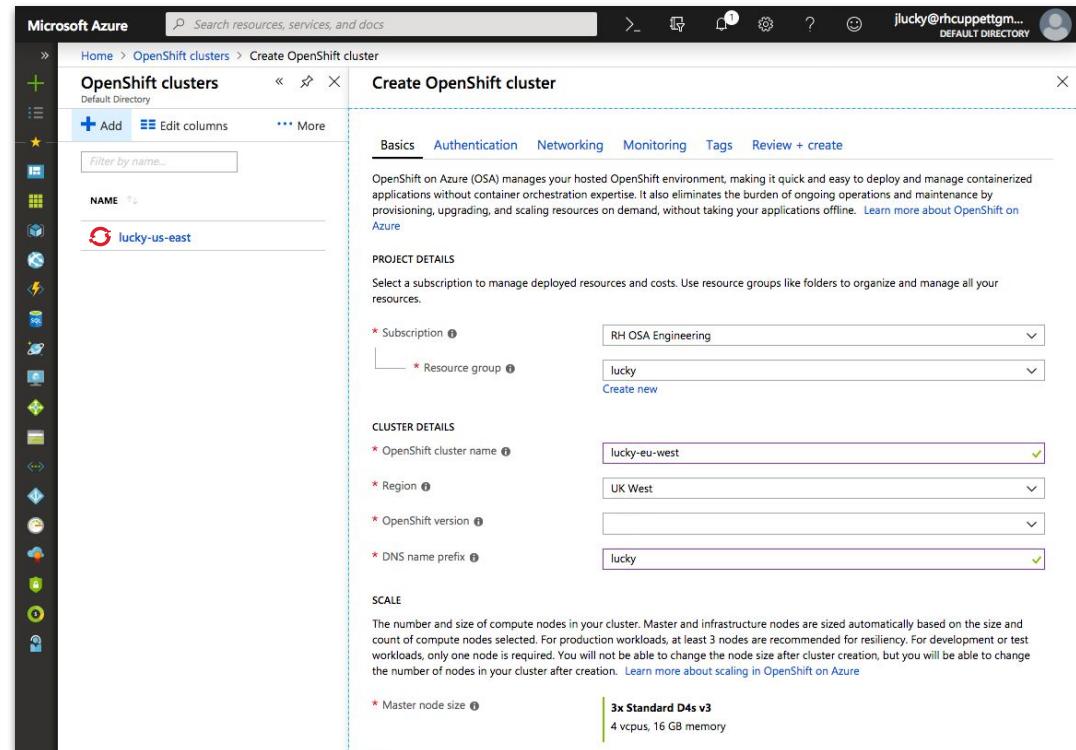

## Egress lockdown

- Documented outbound IP/DNS requirements to secure outbound traffic via firewall

**BYOK disk encryption** for PV's and OS disk

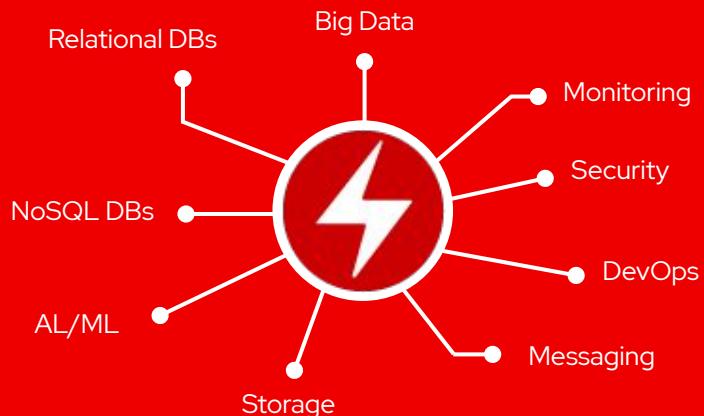

**Larger VM sizes**, including dedicated instances

**Cluster create GUI** in Azure Portal

# A broad ecosystem of workloads

Services allow for a  
SaaS experience on your own infrastructure

# New Operator Bundle Format

The Bundle format uses standard container technology for shipping the metadata and allows developers to publish their own Operator update streams in catalogs. This is very similar to how OCI artifact spec plans to ship non-runnable image artifacts through registries.

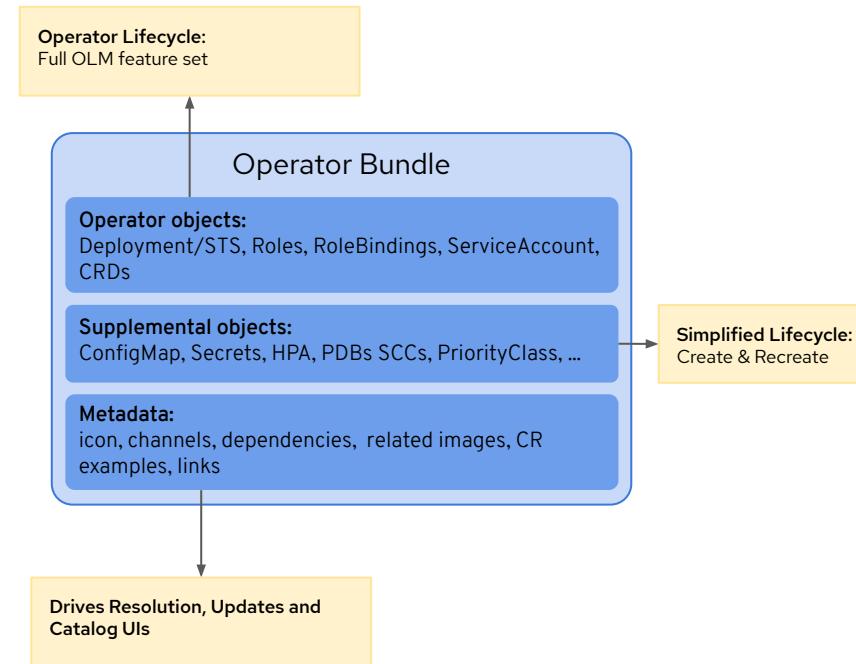

## Changes to building custom catalogs

- Using opm was optional, now it is mandatory
- [Much easier UX to add/remove/update catalog content](#)

```
opm index add
--bundles quay.io/username/my-bundle:0.0.1 # add this bundle
--tag quay.io/username/my-index:1.0.0      # to this catalog
```

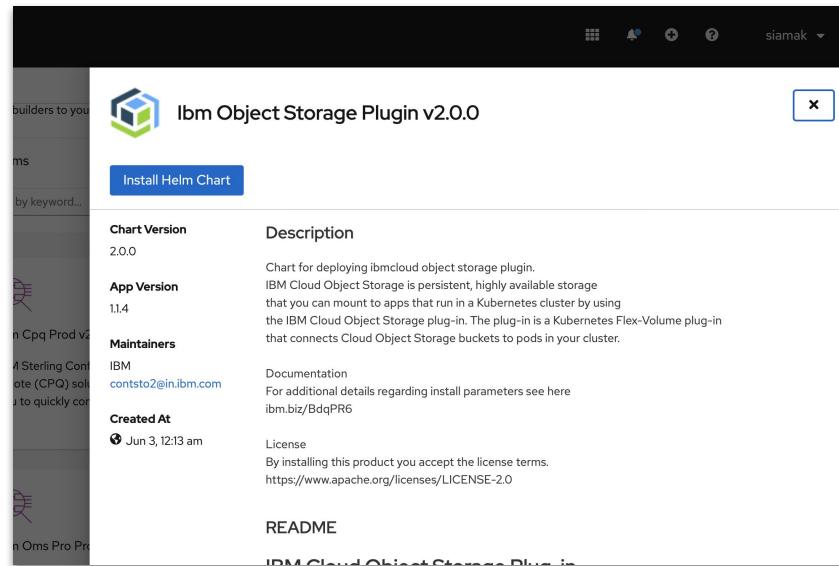

## OpenShift now has per-version Operator catalogs

- Teams can ship to very intentional ranges of OCP versions
- 4.1 to 4.5 will continue to share a single catalog

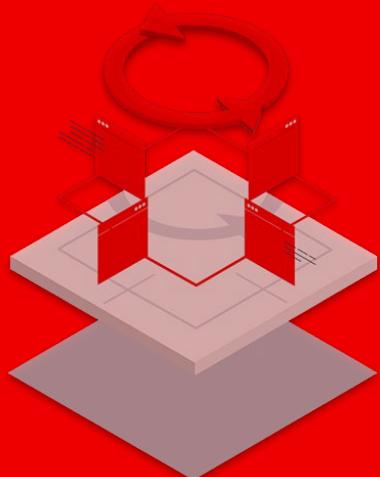

# Helm 3 on OpenShift 4.6

- Helm 3.3 GA
- Support for multiple Helm repositories in Developer Catalog
- Select chart version on install
- Form-based `values.yaml`
- Displays charts compatible with OpenShift version (`kubeVersion`)

# Cloud Native Development

OpenShift has all of the latest **tools** and **services**  
to make your devs more productive

**Code**

**Serverless**

**RED HAT®  
MIDDLEWARE**

**CI/CD**

**Service  
Mesh**

**IBM.  
*Cloud Paks***

# Red Hat Application Services

## Red Hat Runtimes

- **Quarkus** - GA of Native Compilation Support, [OpenShift Extension GA](#) and new Spring compatibilities
- **Data Grid 8.1** - Cross-site cluster support and auto-scaling on OpenShift
- **Red Hat Build of OpenJDK** Support for the [Java Flight Recorder](#) - OpenJDK 8
- **Spring Boot 2.2** - New AMQ Starters, GA of Reactive support and Kubernetes Java annotations.

## Red Hat Integration

- **3scale API Management** - Improved manageability with operator for Air-Gapped deployment, Monitoring & backup/restore. Accelerated API performance with content caching, and new policies for API Gateway.
- **Fuse** - Air-Gapped deployment, OpenShift AuthN/AuthZ for Console, and Spring Boot 2 support for Fuse on OpenShift.
- **Camel K for Serverless (TP)** - now integrated to OpenShift Developer Console to leverage the huge Camel connector catalog for apps based on Camel K and Knative Eventing.

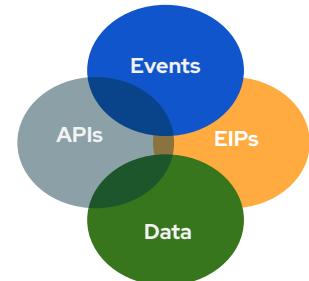

## Red Hat Process Automation

- **OptaPlanner** - Support for new rotation screen in Optaweb Employee Rostering
- **Dashboard Builder** - Stand alone Dashbuilder: Support for multiple dashboards, Runtime REST api, React components

# Migration Toolkit for Applications

MTA 5.0 Launched

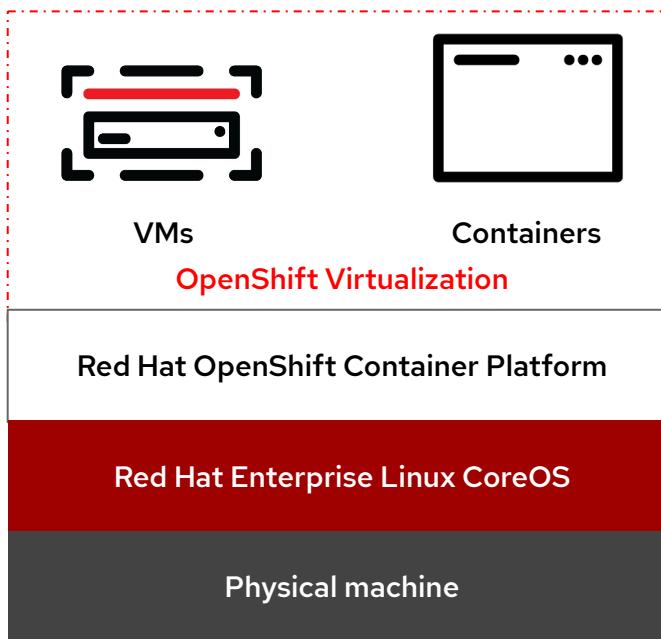

- **Review Java Apps** - review source code or decompile binaries and find ways to make them more JEE compliant, and container friendly.
- **OpenJDK, Container and Linux rules** - discover fixes to be applied to your app to increase its mobility
- **Camel 2 to 3 Rules** - review your Camel 2 rules and find out how to convert them to Camel 3 (more container friendly).
- **Web,CLI, Maven and IDE** - use the tool in any your preferred context, from CI/CD pipelines , to maven builds and in within your development environment. Easy to deploy on OpenShift.

red.ht/mta

# What's new in OpenShift Virtualization (2.5)

Modernized workloads, support mixed applications consisting of VMs, containers, and serverless

## Core

- Deploy operator on a subset of cluster nodes
- Import from VMware - cold or offline migration
- Robust VM baseline performance

## Network

- Support of bonding modes 2 (balance-xor) and 4 (802.3ad)
- Added CNI certification test suite for VMs

## Storage

- Improved dev workflow with default OS images & templates
- Fast DataVolume CDI cloning via CSI Snapshots
- Offline VM Snapshots
- Import ContainerDisks to persistent storage more efficiently

# Service Mesh

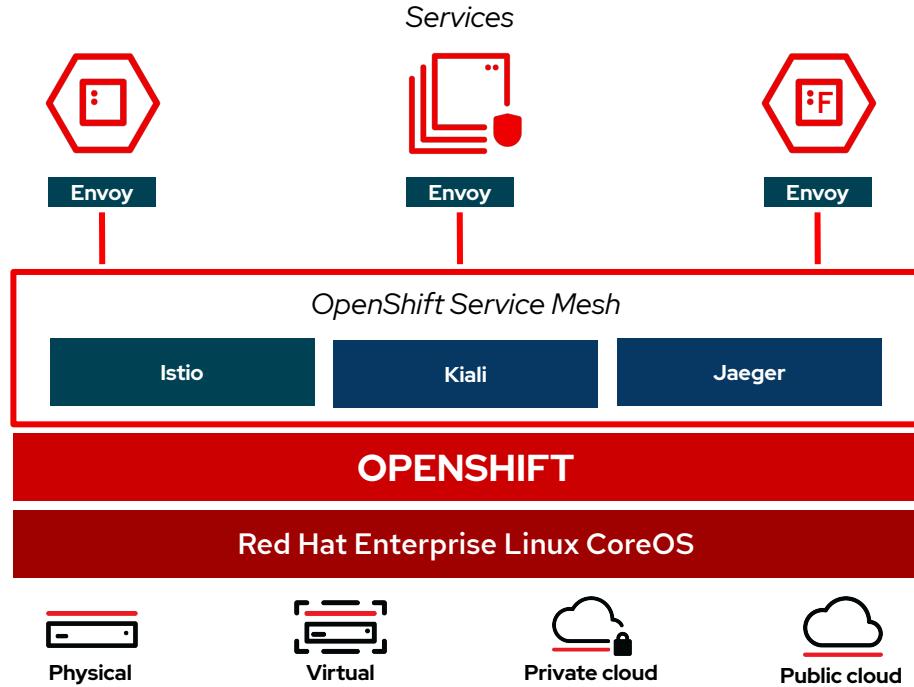

# OpenShift Service Mesh

Connect, Secure, Control and Observe Services on OpenShift

- Connect services securely with zero-trust network policies.
- Automatically secure your services with managed authentication, authorization and encryption.
- Control traffic to safely manage deployments, A/B testing, chaos engineering and more.
- See what's happening with out of the box distributed tracing, metrics and logging.
- Manage OpenShift Service Mesh with the **Kiali** web console.

[Product briefing deck](#)

\* Eventing is currently in Technology Preview

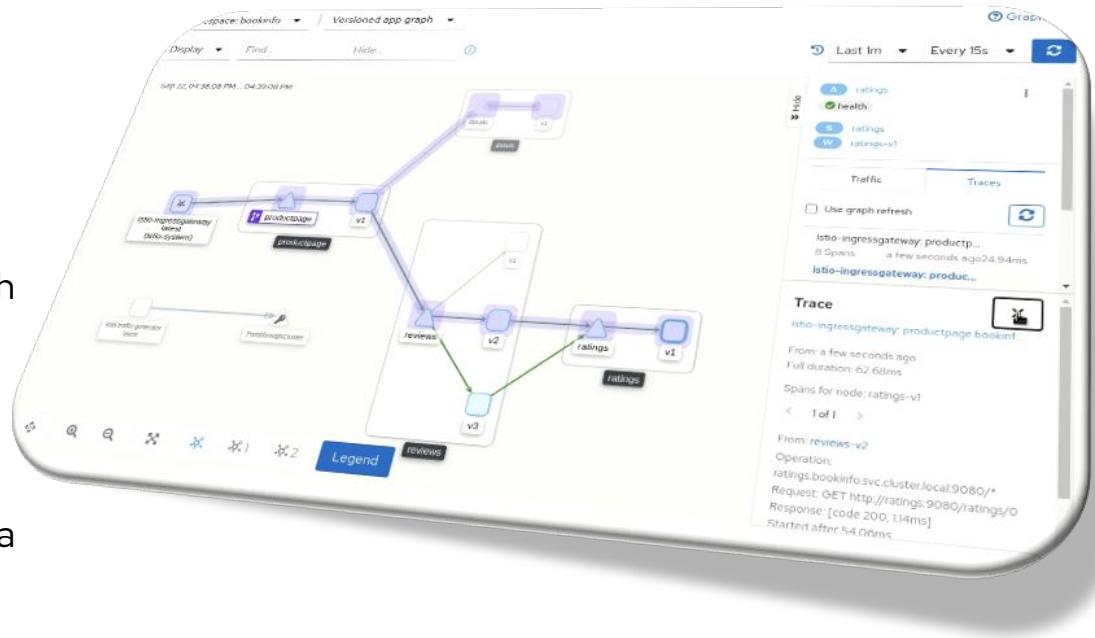

\*\* Functions are currently a work in progress initiative

# OpenShift Service Mesh 2.0

## Key Features & Updates

- Version 2.0 to GA in November 2020
- Upgrades Istio to version 1.6
- Simplifies architecture based on a single Istio daemon ("Istiod")
- Improves key and certificate rotation with Secret Discovery Service
- Improves metrics collection with Telemetry V2 architecture.
- Introduces WebAssembly extensions as a "Tech Preview" feature.

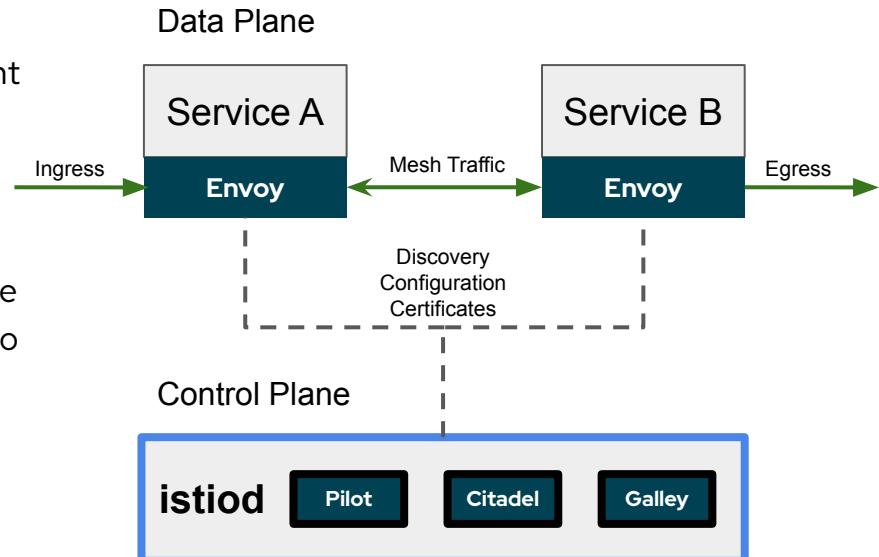

# OpenShift Service Mesh 2.0

## Istio 1.6 - Architectural Changes

- Consolidates the Istio control plane components (Pilot, Galley, Citadel) into a single binary known as **istiod**.
  - Simplifies installation, upgrades and management of the Control Plane.
  - Reduces the Control Plane's resource usage, startup time and improves performance.
- Secret Discovery Service (**SDS**) provides a more secure and performant mechanism for delivering certificates to Envoy side car proxies.
  - Removes the use of Kubernetes Secrets.
  - Enables 3rd party cert manager integrations.
- New **Telemetry V2** architecture substantially reduces metrics collection latency.

# OpenShift Service Mesh 2.0

## Secret Discovery Service

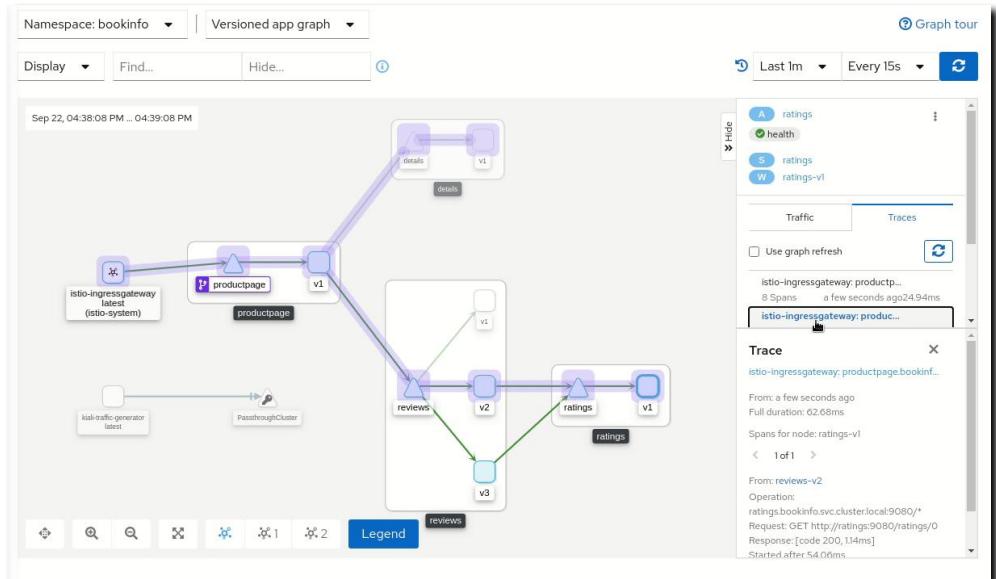

- Secret Discovery Service (**SDS**) is a more secure and performant mechanism for delivering secrets to Envoy side car proxies.
  - Removes the need to use Kubernetes Secrets, which have well known security risks.
  - Improves performance during certificate rotation, as proxies no longer require a restart.
  - Enables integration with 3rd party certificate managers, such as Vault.

# OpenShift Service Mesh 2.0

## User Experience Enhancements

- New **ServiceMeshControlPlane** resource (v2) to simplify configuration.
- **Kiali:**
  - Distributed traces are visualized and accessible in the service graph.
  - New wizards make it easier to configure timeouts, retries and fault injection scenarios.
- **Jaeger:**
  - Support for external ElasticSearch clusters.
  - OpenTelemetry collector in Tech Preview enabling vendor-neutral instrumentation.

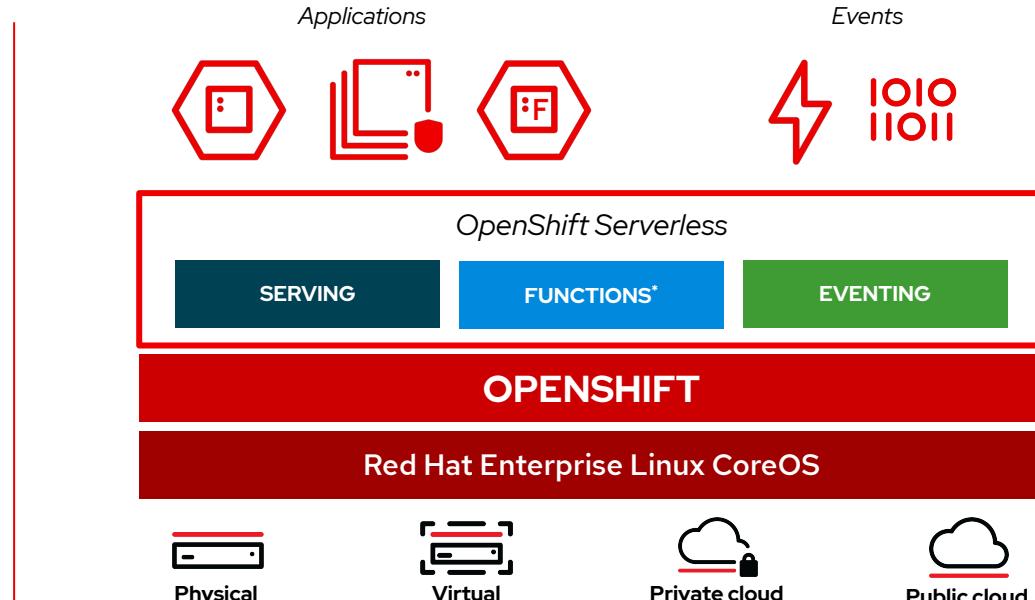

# Serverless

# OpenShift Serverless

Event-driven serverless containers and functions

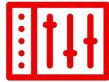

*Packages and Extends  
**Knative** with **Functions**  
and is installed and  
managed by an **Operator***

\* Developer Preview

# Serverless Themes

## Day 2

Powerful monitoring capabilities with configuration and automation for GitOps and modern CI/CD practices.

## Integrations and Ecosystem

Eventing capabilities enabling a rich ecosystem Event Sources from Red Hat and Partner products.

## Developer Experience

Intuitive developer experience through the Developer Console and CLI/IDE with Functions support.

# Serverless & the Portfolio

- ✓ OpenShift Service Mesh Support [\[doc\]](#)
  - Support for JWT Auth [\[doc\]](#)
  - Custom Domains for Knative Services [\[doc\]](#)
- ✓ OpenShift Pipelines Templates and Tasks
- ✓ CLI Commands for Eventing

Service  
Mesh

Serverless

Pipelines

The screenshot shows the Red Hat OpenShift Container Platform web console. The left sidebar includes links for Developer, Topology, Monitoring, Search, Builds, Pipelines, Helm, Project, Config Maps, Secrets, Pods, Image Streams, and Secrets. The main content area is titled 'Topology' and shows a message: 'No resources found. To add content to your project, create an application, component or service using one of these options.' Below this are several cards: 'Quick Starts' (Exploring Serverless applications, Deploying an application with a pipeline, Getting started with a sample), 'Samples' (Create an application from a code sample), 'From Git' (Import code from your Git repository to be built and deployed), 'Container Image' (Deploy an existing image from an image registry or image stream tag), 'From Dockerfile' (Import your Dockerfile from your Git repository to be built and deployed), 'YAML' (Create resources from their YAML or JSON definitions), 'From Catalog' (Browse the catalog to discover, deploy and connect to services), 'Database' (Browse the catalog to discover database services to add to your application), 'Operator Backed' (Browse the catalog to discover and deploy operator managed services), 'Helm Chart' (Browse the catalog to discover and install Helm Charts), 'Pipeline' (Create a Tekton Pipeline to automate delivery of your application), and 'Event Source' (Create an event source to register interest in a class of events for particular system). At the bottom, there is a 'Channel' section with the heading 'Create a Knative Channel to create an event forwarding and persistence layer with in-memory...' and a link: 'https://console-openshift-console.apps.default.openshiftinbound.svc.cluster.local/import'.

***Serverless & Pipelines Experience***

# Functions

Coming with OpenShift Serverless 1.11

## Powerful CLI experience

- ✓ Local Developer Experience
- ✓ Based on Buildpacks
- ✓ Deploy as Knative Service
- ✓ Project templates
- ✓ Support for Cloud Events/HTTP
- ✓ **Runtimes:**

```
$ kn faas help
Usage:
  faas [command]

Available Commands:
  build      Build an existing Function project as an OCI image
  completion Generate bash/zsh completion scripts
  create     Create a new Function, including initialization of
             local files and deployment
  delete     Delete a Function deployment
  deploy     Deploy an existing Function project to a cluster
  describe   Describes the Function
  help       Help about any command
  init       Initialize a new Function project
  list       Lists deployed Functions
  run        Runs the Function locally
  update     Update a deployed Function
  version    Print version. With --verbose the build date stamp
             and commit hash are included if available.
```

# Functions

Coming with OpenShift Serverless 1.11

The screenshot displays the Red Hat OpenShift Developer console interface. On the left, a sidebar lists various developer tools: Topology, Monitoring, Search, Builds, Pipelines, Helm, Project, Config Maps, Secrets, Pods, Image Streams, and Secrets. The 'Topology' option is selected. The main area shows a 'Topology' graph for the 'markito' project. The graph consists of several nodes connected by lines: a 'jira' node (with a blue arrow icon), an 'in-mem-channel' node (with a clock icon), a 'spring-ic-app' node (with a blue gear icon), and two 'dometro-app' nodes (each with a blue gear icon). The 'dometro-app' nodes are enclosed in a dashed box. A terminal window on the right shows a session for 'markito@anakin /tmp/myfunc'. The user has run the command '\$ ls' which returns the output '\$ ls' and '\$ markito@anakin /tmp/myfunc\$'. Below the terminal is a status bar with navigation icons.

# Red Hat's OpenShift Serverless for hybrid, legacy and greenfield

**FEBRUARY 21 2020**

By **William Fellows**

Kubernetes is complex and difficult to deploy – it autoscales based on available resources, not on requests themselves. OpenShift Serverless is designed to resolve this complexity to deliver the benefits ‘as advertised’ of quicker time to market and faster recovery.

# CI/CD & GitOps

# OpenShift Pipelines

Kubernetes-native  
declarative  
Pipelines with  
Tekton

Serverless CI/CD  
with no single  
server to share and  
maintain

Run pipelines in  
isolated containers  
with all required  
dependencies

Standard and  
portable to any  
Kubernetes  
platform

Web, CLI, and  
Visual Studio  
Code and IDE  
plugins

# OpenShift Pipelines 1.2\*

- Pipeline templates for serverless when importing application (+Add)
- Pipeline templates use workspaces instead of PipelineResources
- Default workspace per PipelineRun or globally
- Expanded Task library
  - Helm tasks
  - Skopeo tasks
  - Trigger Jenkins jobs from Tekton
- Support for disconnected clusters
- Pipeline metrics in cluster monitoring
- Pipeline Quick Start tours in Dev Console
- Enhancements in Tekton CLI: workspaces, results, ...

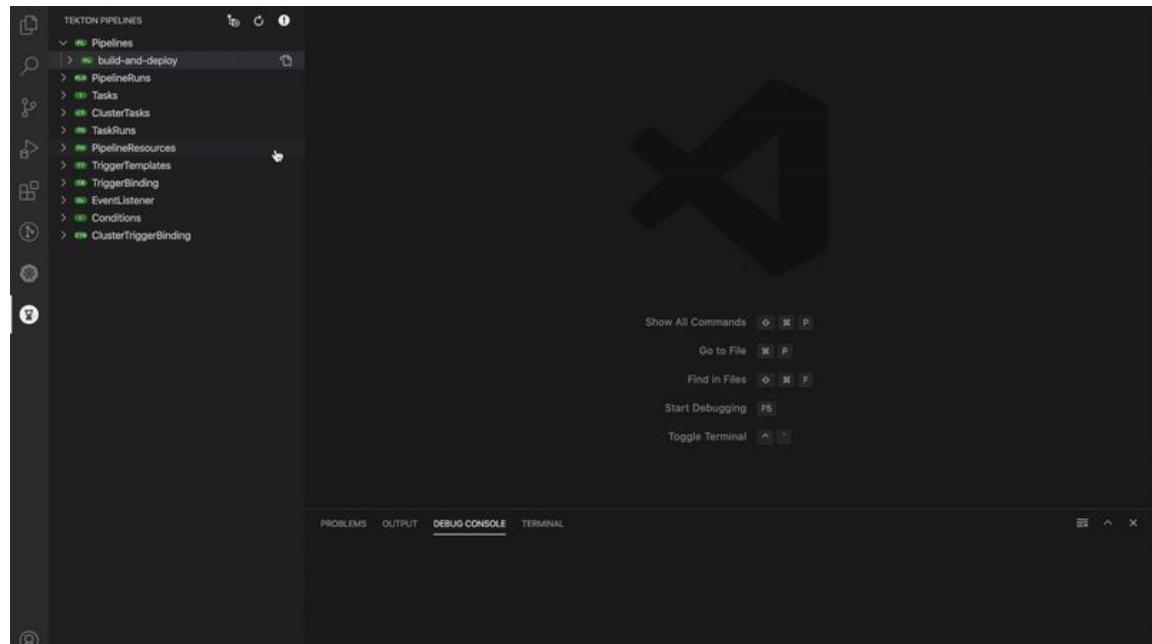

The screenshot shows the Red Hat OpenShift Dev Console interface. On the left is a sidebar with navigation links: Developer, +Add, Topology, Monitoring, Search, Builds, Pipelines, Helm, Project, Config Maps, Secrets, Cluster Tasks, and Pipeline Resources. The main area is titled "Topology" and shows a message: "No resources found. To add content to your project, create an application, component or service using one of these options." Below this are four "Quick Starts" cards:
 

- Setting up Serverless**: Deploying an application with a pipeline. Sub-options include "Getting started with a sample" and "See all Quick Starts".
- Samples**: Create an application from a code sample.
- From Git**: Import code from your Git repository to be built and deployed.
- Container Image**: Deploy an existing image from an image registry or image stream tag.

 A sidebar on the right provides information about the tour: "Deploying an application with a pipeline" (10 minutes), "This quick start guides you through creating an application and associating it with a CI/CD pipeline.", and a numbered list: 1 Importing an application and associate it with a pipeline, 2 Exploring your application, 3 Starting your pipeline. A "Start Tour" button is at the bottom right.

# Tekton Pipelines in IntelliJ & Visual Studio Code

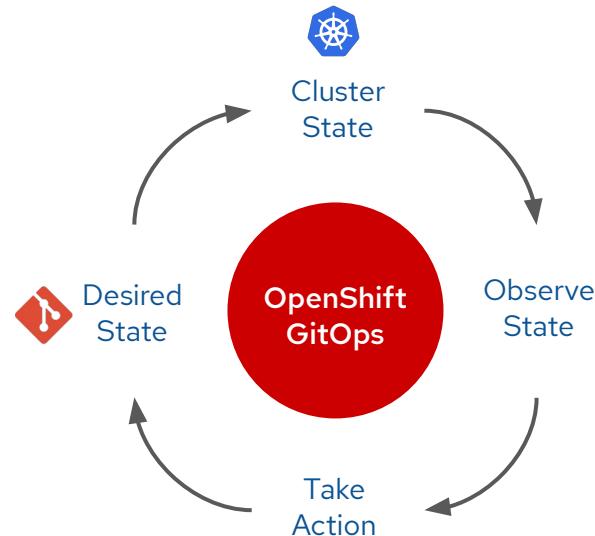

- Start pipeline wizard
- Add trigger wizard
- Open Tekton docs from YAML
- Restart pipeline action

# OpenShift GitOps

(new add-on)

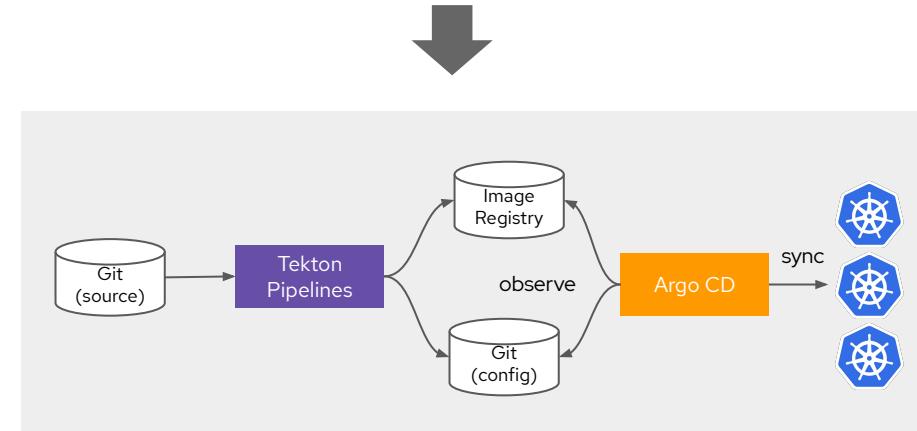

- Enable teams to adopt a declarative GitOps approach to multi-cluster configuration and continuous delivery
- OpenShift GitOps is complementary to OpenShift Pipelines and includes
  - Argo CD
  - GitOps Application Manager CLI
  - Integrated into Dev Console (App Stages)
- Included in OpenShift SKUs

# GitOps Application Manager CLI

- Enable teams to adopt GitOps for app delivery
- scaffolds Git repos and CI/CD for services
  - Git as the single source of truth
  - Application Stages (environments)
  - Tekton pipelines for CI
  - Argo CD for multi-cluster CD
  - Kustomize for cluster-specific configs
  - Sealed secrets
- Download GitOps Application Manager CLI  
[github.com/redhat-developer/kam/releases](https://github.com/redhat-developer/kam/releases)
- Application Stages in Dev Console

```
$ kam bootstrap  
$ kam environment add
```

[demo](#)

# Application Stages in Dev Console

The screenshot shows the Red Hat OpenShift Dev Console interface. The top navigation bar includes the 'okd' logo, a developer dropdown, and a message: 'You are logged in as a temporary administrative user. Update the [cluster OAuth configuration](#) to allow others to...'. The left sidebar has a 'Developer' dropdown and links for '+Add', 'Topology', 'Monitoring', 'Search', 'Builds', 'Pipelines', 'Application Stages' (which is selected and highlighted in blue), 'Helm', 'Project', 'Config Maps', and 'Secrets'. The main content area is titled 'Application Stages' and displays a card for 'app-taxi' with a green application icon, the name 'app-taxi', and '3 Environments'. A cursor arrow is visible near the bottom right of the card.

# CodeReady / Dev Tools

# Service Binding Operator

- Automate configuring applications to find the coordinates of the backing service (database, mq, etc)
  - Operator services
  - Helm Charts
  - Any k8s resource
- Injects service coordinates into **Deployments**, **DeploymentConfig**, **Knative Service** and more
- Requires services to advertise injectable configuration via annotation present on k8s resources

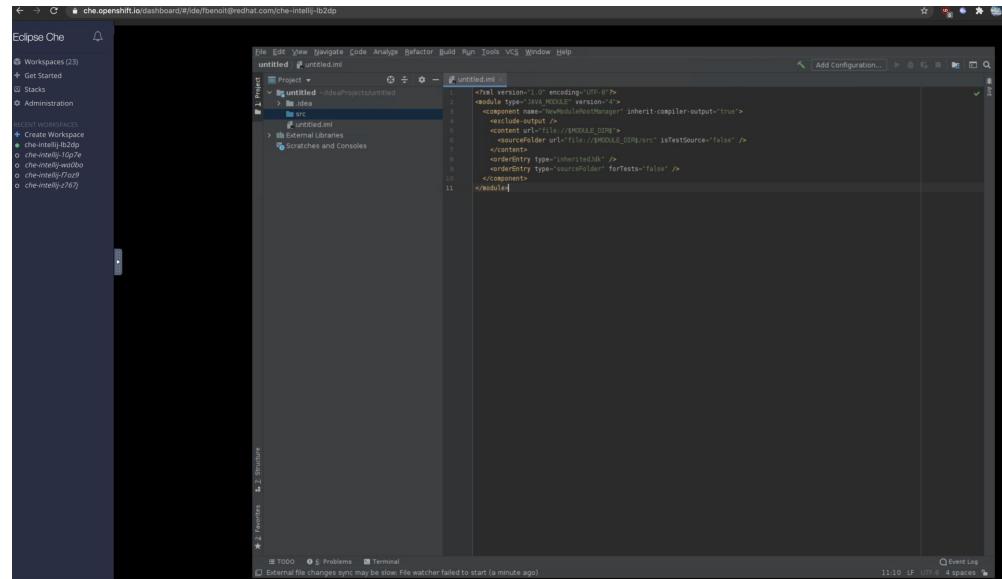

```

kind: ServiceBinding
metadata:
  name: binding-request
spec:
  application:
    name: cool-app
    resource: deployments
    group: apps
    version: v1
  services:
    - group: postgresql.baiju.dev
      version: v1alpha1
      kind: Database
      name: cool-db
  
```

# CodeReady Workspaces 2.5

Targeted for Nov 4

- **Support for IBM Z (v2.4)** - run on OpenShift on IBM Z
- **Single host proxy** - route ingress to all components from single host
- **Support OpenShift-trusted CA bundle (v2.4)**
- **Experimental support for IntelliJ as IDE** - community edition with steps to use customer's licensed version

# odo 2.0 - OpenShift's Dev-Focused CLI

Released September 24th!

Core language support via a common/shared model with Eclipse Che with **devfile** stack definitions

Start quickly using linked samples

Works with core Kubernetes!

- Creation of operands
- Binding of services

Easily connect for debugging

```
$ odo catalog list components
```

```

**StatefulSet Details**

# Managing Operators at ease

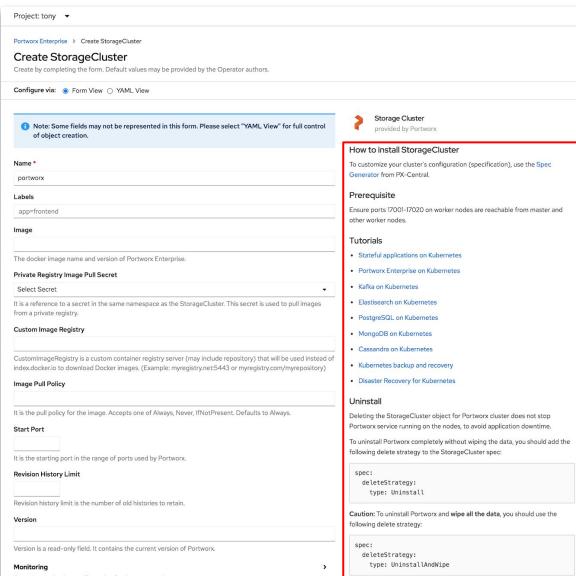

## Surface Operand's Event stream on Operand's Details page

- Easier see the ***Operand's Events*** stream directly on the details page under "Operators" nav section for troubleshooting.

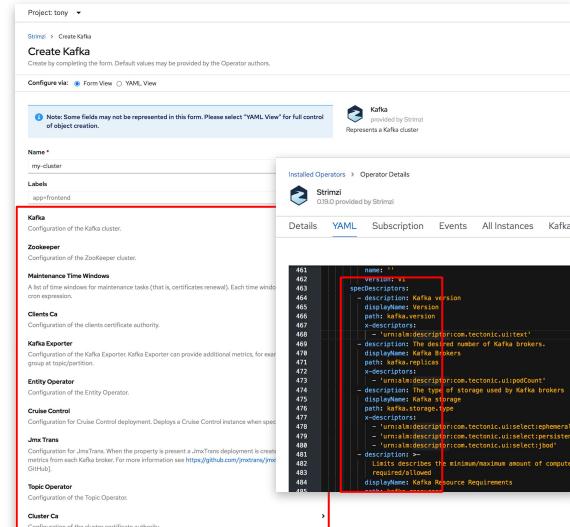

**Console supports markdown for CRD description stored in Operator's CSV**

- Provides *instructions*, *prerequisites*, or *tutorials* with *external links* to guide users how to *create* and *manage* an Operand / custom resource instance.

## Customize the order of form fields with OLM descriptors in Operator's CSV

- The creation form fields are ordered by the ***specDescriptors array order*** in CSV file.
  - Renders CRD ***schema description*** as the ***help text*** for each property field if no specDescriptors assigned.

# Getting started experience

## Default Perspective --and-- Guided Tour

- Non privileged users are brought to Developer perspective by default upon initial login
- A Guided Tour has been added to the Developer Perspective to help with discoverability

## Quick Starts

- Guides customers with interactive documentation tours
- Helps customers to discover and enable value added services
- Reduces the time it takes to get customers up and running
- Educes users on how to maximize usage of the UI
- Accessible on both the Administrator and Developer perspectives

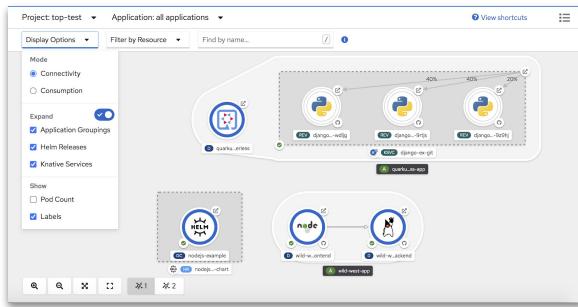

## Getting started with samples

- Developer get started quickly with samples

# Application topology

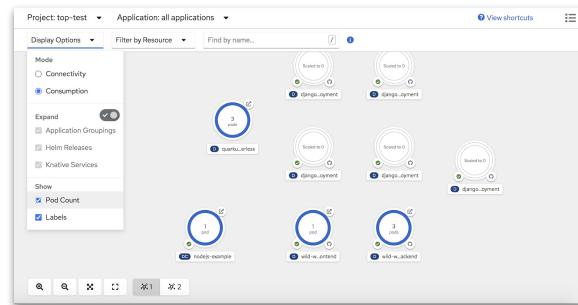

## Connectivity mode

- Allows developers to focus on the composition of their application, both on how it's managed as well as how things are connected.

## Consumption mode

- Allows developers to focus solely on components consuming resources.
- Thus, no connectors are shown (Service Binding, Visual, Traffic, Triggers, etc), nor groupings. Pod count is shown by default.

## Parity between List & Graphical

- Display Options
- Filters
- Find

**Admin's Project-> Workload tab has an increased feature set**

# Visibility of apps across environments

Dev Preview

**Empower developers with visibility of their application across all environments**

- Dedicated **Application Stages** view
- View all app groupings
- Drill into app grouping details to get visibility into the composition and status of the applications/workloads deployed across environments

The screenshot shows the OpenShift 4.6 interface with a dark theme. The left sidebar has a 'Developer' dropdown and a list of options: +Add, Topology, Monitoring, Search, Builds, Pipelines, Application Stages (which is selected and highlighted in blue), Helm, Project, Config Maps, and Secrets. The main content area is titled 'Application Stages' and shows a single item: 'app-taxi' with '3 Environments'. The top right corner shows a notification icon with '10', a user icon, and the text 'kube:admin'. A red banner at the top right says 'Dev Preview'.

# Easy access to Kiali

## Easy access to the Kiali UI from the OpenShift Developer perspective

The screenshot shows the OpenShift developer interface with the Kiali dashboard open. The dashboard has sections for Overview, Details, and Project Access. In the Details section, there is a 'Service Mesh' status card indicating 'Service Mesh Enabled'. A blue dotted arrow points from this status card to a callout bubble labeled 'Launcher' with the text 'Open on Kiali'.

When OpenShift Service Mesh is enabled on the cluster:

- Developers can easily **navigate to the Kiali dashboard** from
  - Topology view
  - Project Overview
  - Project Details page
- Developers can easily see if **Service mesh is enabled** for the project in context

The screenshot shows the OpenShift developer interface with the Project Details page for the 'viral' project open. In the 'Overview' tab, there is a 'Service Mesh' status card indicating 'Service Mesh Enabled'. A blue dotted arrow points from this status card to a callout bubble labeled 'Launcher' with the text 'Open on Kiali'.

# Observability

# "Tune" Fluentd

## Expose selected Fluentd performance optimization parameters in the ClusterLogging API.

- Not relevant to most users, default settings should give good general performance.
- Ultimately we want great performance "out of the box" with no user intervention. However, today we can't always predict/detect the best settings; customers have had to adjust fluentd parameters to get good performance.
- All possible settings relate to optimizing the forwarding process, meaning when logs leave Fluentd to either our internal storage or a configured 3rd party system.
- Settings include retries, memory usage and the flushing output behaviour.

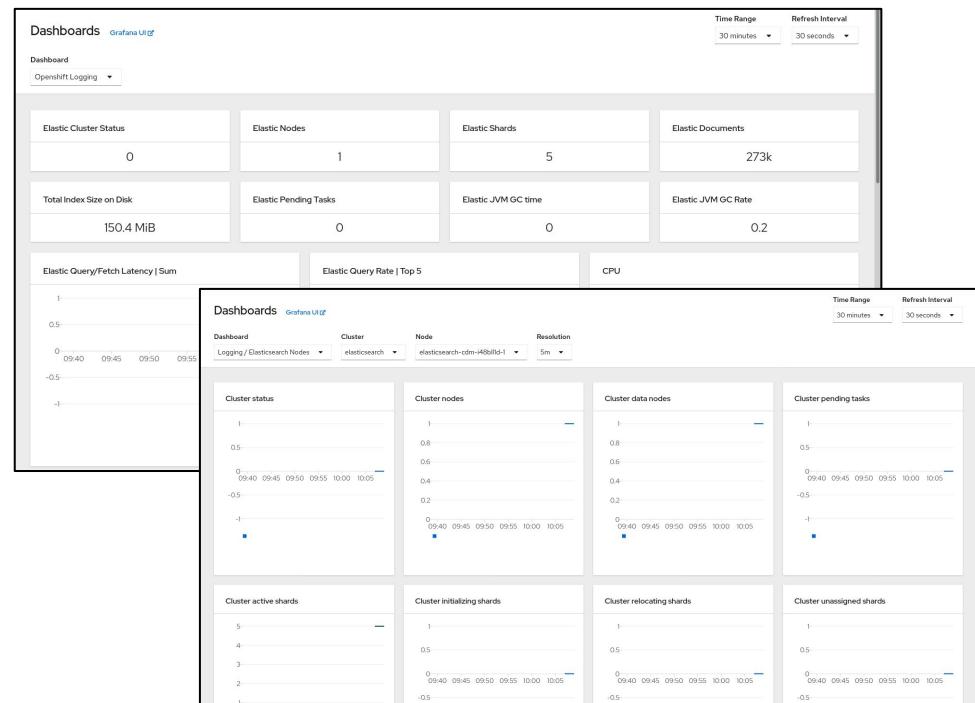

1. After installing OpenShift Logging, apply the following YAML.

```
apiVersion: logging.openshift.io/v1
kind: ClusterLogging
metadata:
  name: instance
  namespace: openshift-logging
spec:
  forwarder:
    fluentd:
      buffer:
        chunkLimitSize: 8m
        flushInterval: 5s
        flushMode: interval
        flushThreadCount: 3
        overflowAction: throw_exception
        retryMaxInterval: "300s"
        retryType: periodic
        retryWait: 1s
        totalLimitSize: 32m
```

# Logging “Observability”

## Improve our current Monitoring capabilities to better help admins to gain insights into OpenShift Logging.

- Introduce dashboards into the OpenShift Console (admin perspective) that shows the most critical data points for admins to proactively research problems.
  - Two new dashboards: OpenShift Logging (central overview look) and Elasticsearch.
  - Access from *Monitoring -> Dashboards* and select either from the dropdown list.
- Enrich and/or improve current alerting rules to cover "you must page me at 3am" scenarios.
- Overhaul metrics where necessary.
  - **Note:** Removed all index level metrics since they introduced an abnormal amount of metrics which ended up exploding our Monitoring solution. We will reintroduce some + improvements in a future release.

# Install & Upgrades

# New Credential Modes for OpenShift Installation

## Specify how *CredentialsRequests* are satisfied

- Allows users to define how *CredentialsRequest* are handled on behalf of OpenShift components requiring cloud API access.
- Three new modes can now be specified for deployments on AWS, Azure, and GCP:
  - Mint:** Creates new credentials with a subset of the overall permissions as specified by the *CredentialsRequest*.
  - Passthrough:** Uses the provided credentials "as is" for each OpenShift component's *CredentialsRequest*.
  - Manual:** *CredentialsRequests* must be manually handled by the user (*useful for cases where access to the IAM endpoint has been restricted.*)
- If the field is set to any of the above values, then the installer will not attempt to check the credential permissions prior to installing OpenShift.
  - Important for situations where the credential policy checking can't adequately validate the user credentials (*when using SCP on AWS.*)

```
% ./openshift-install explain installconfig.credentialsMode
KIND:   InstallConfig
VERSION: v1

RESOURCE: <string>
  CredentialsMode is used to explicitly set the mode with which CredentialRequests are satisfied.
  If this field is set, then the installer will not attempt to query the cloud permissions before attempting installation. If the field is not set or empty, then the installer will perform its normal verification that the credentials provided are sufficient to perform an installation.
  There are three possible values for this field, but the valid values are dependent upon the platform being used. "Mint": create new credentials with a subset of the overall permissions for each CredentialsRequest "Passthrough": copy the credentials with all of the overall permissions for each CredentialsRequest "Manual": CredentialsRequests must be handled manually by the user
  For each of the following platforms, the field can set to the specified values. For all other platforms, the field must not be set.
```

# AWS Custom Endpoint Support

## Define custom API endpoints for private AWS regions

- Adds a new field 'serviceEndpoints' in install-config.yaml, which contains a list of custom endpoints for overriding the default service endpoints of AWS services.
- Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.
- Only required for cases where alternative AWS endpoints (like FIPS) need to be used.
  - *Note: Not needed for deploying to known regions (which are found in the AWS SDK.)*
- List of AWS service endpoints can be found here:  
<https://docs.aws.amazon.com/general/latest/gr/aws-service-information.html>

```

apiVersion: v1
baseDomain: example.com
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  Platform: {}
  replicas: 3
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master

publish: External

```

# User Defined Routing on Azure

## Define custom API endpoints for private Azure regions

- Today, internal clusters on Azure always use Public Standard Load Balancers for Internet egress. This means public IPs and public load balancers are required, which many customers don't want to use for internal clusters.
- User Defined Routing allows the users to choose their own outbound routing for Internet access enabling them to leverage pre-existing setups instead of defaulting to the per-cluster OpenShift recommended way.
- Users are only allowed to change the outbound type when using pre-existing networking since outbound routing needs to be setup by user prior to installing the cluster.
- Adds a new egress strategy 'UserDefinedRouting' to the 'outboundType' field in the install-config

```

apiVersion: v1
baseDomain: example.com
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 3
controlPlane:
  architecture: amd64

```

# Specify Disk Type & Size for Control Plane & Compute Nodes on Azure & GCP

## Configure both disk type and size based on node requirements

- Support for configuring disk type and size on control plane and compute nodes has been extended to Azure & GCP.
- Introduces two new fields 'osDisk.diskSizeGB' & 'osDisk.diskType' in the install-config
- For Azure, supported disk types include:  
"Standard\_LRS", "Premium\_LRS", & "StandardSSD\_LRS"
  - Note: For control plane nodes only "Premium\_LRS" & "StandardSSD\_LR" can be configured.*
- For GCP, supported disk types include: "pd-ssd" & "pd-standard"
  - Note: For control plane nodes only "pd-ssd" can be configured.*

```

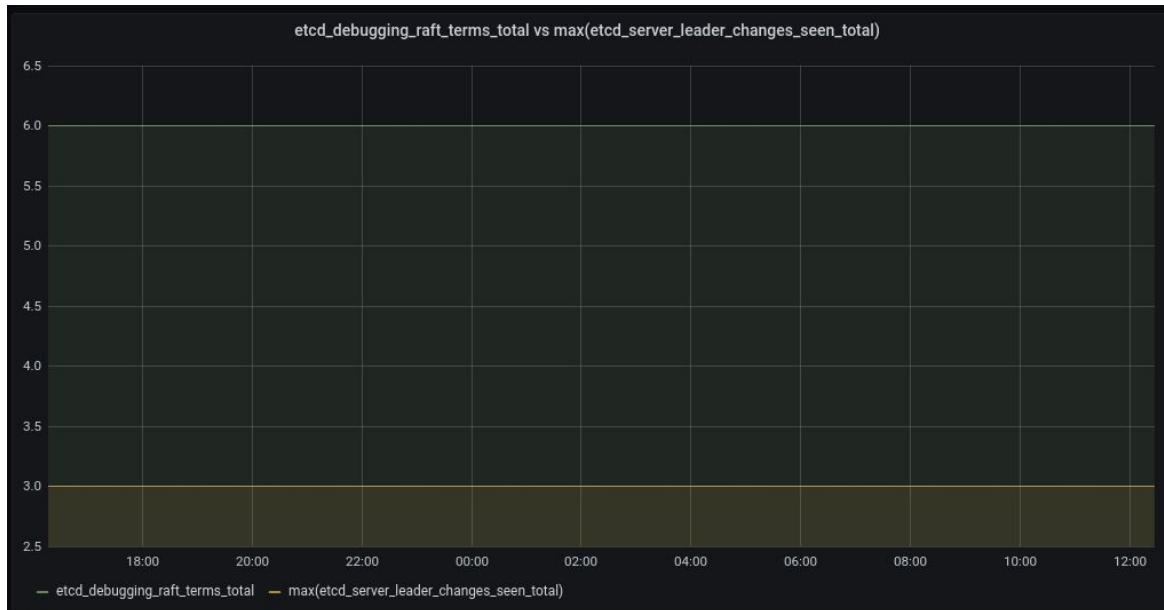

apiVersion: v1
baseDomain: example.com
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
  - osDisk:
    DiskSizeGB: 120
    DiskType: pd-standard

```

# Control Plane

# etcd Improvements

- Support for etcd's golang pprof endpoint by default. This will allow for easier profiling of etcd resource utilization.
- Use `ionice -c2 -n0` for etcd process which improves I/O priority scheduling.
- New metric `etcd_debugging_raft_terms_total` this metric is used to expose actual raft terms through Prometheus metrics. This experimental metric can assist in triage of etcd performance issues.

# Improved Recovery Time After Hard Shutdown of Master Node

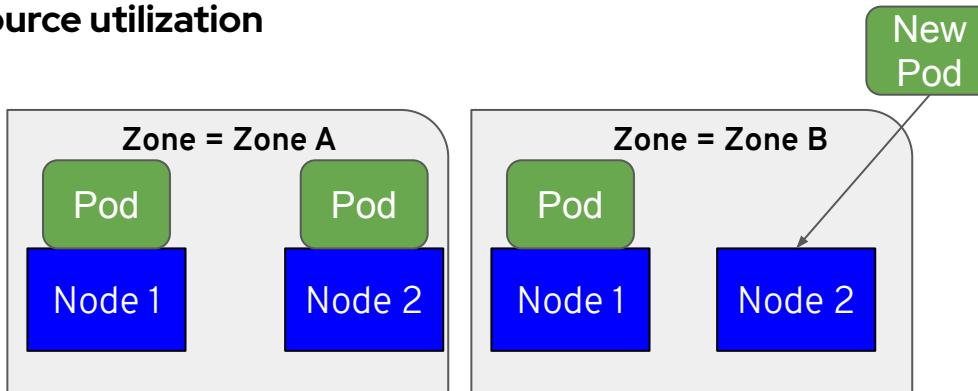

After a hard shutdown of a master node, the result of a failure or not, the OpenShift APIs would become unavailable for a lengthy period of time (15min+) while the endpoints were reconciled and the cluster detected and adapted to the loss of the node.

For OpenShift 4.6, the recovery time of the control plane was dramatically improved, in most cases, to ~90s.

# Pod Topology Spread Constraints

Control how **Pods are spread** across the cluster among **failure-domains** such as regions, zones, nodes, and other user-defined topology domains.

Help to achieve **high availability** as well as **efficient resource utilization**

```
kind: Pod
apiVersion: v1
metadata:
  name: mypod
  labels:
    foo: bar
spec:
  topologySpreadConstraints:
  - maxSkew: 1
    topologyKey: zone
    whenUnsatisfiable: DoNotSchedule
    labelSelector:
      matchLabels:
        foo: bar
```

## OCP CLUSTER INFRASTRUCTURE

# Cluster Infrastructure updates

- Expanding Spot Instance support
  - Azure: machine API support for spot instances
  - GCP: machine API support for Preemptible VM instances
- Security and Compliance
  - AWS: Support for custom endpoints and air-gapped regions
  - Azure: Support for GovCloud
- Usability
  - AWS Machine API Support of more than one block device
  - Get validation/defaulting for providerSpec APIs

## MachineSet

```
apiVersion: machine.openshift.io/v1beta1
spec:
  metadata:
    creationTimestamp: null
  providerSpec:
    spotMarketOptions:
      maxPrice: "0.06"
```

Generally Available

# RHEL CoreOS

# Red Hat Enterprise Linux CoreOS

RHCOS 4.6 EUS

- Aligned for full life cycle with RHEL 8.2.z EUS stream
- Stable 4.18 kernel ABI allowlist
- Deploy /var on a separate disk
- Extension system with usbguard

# Updated CoreOS Image & Installer

## Key Features

- Hardware and interface name discovery
- Preserve existing data partitions option
- Automatic 4K-sector drive detection
- Easily embed custom ignition configuration into custom ISOs for installation in environments with restricted networking
- Live PXE and Live ISO environment

```
Red Hat Enterprise Linux CoreOS 46.82.20200928174-0 (ootpa) 4.6
SSH host key: SHA256:mmPpxnYfcrxMsMng0c72dEm6GqoM5Bx/e0P3bm1Dsuv4 (ECDSA)
SSH host key: SHA256:Nb30rUtSbanzeLyT4quStnH1116aFFZGZrmNWJMIdQ (ED25519)
SSH host key: SHA256:u1wL1agK+UIGNLn5iBU8+bHBryk3QWGgNpZ8KfofZFa (RSA)
enp1s0: 192.168.122.51 fw80::5054::ff:fe6a:addr7
enp6s0: 192.168.122.145 fe80::5054::ff:fe78:befc
localhost login: core (automatic login)

#####
Welcome to the CoreOS live environment. This system is running completely
from memory, making it a good candidate for hardware discovery and
installing persistently to disk. Here is an example of running an install
to disk via coreos-installer:

sudo coreos-installer install /dev/sda \
    -- ignition-url https://example.com/example.ign

You may configure networking via 'sudo nmcli' or 'sudo nmtui' and have
that configuration persist into the installed system by passing the
'--copy-network' argument to 'coreos-installer install'. Please run
'coreos-installer install --help' for more information on the possible
install options.
#####

[core@localhost ~]$
```

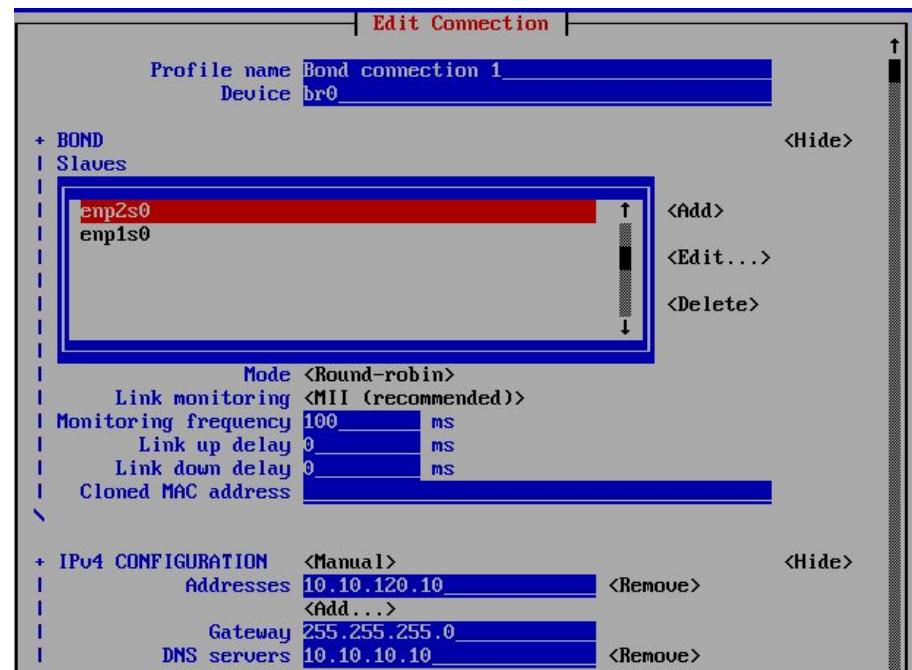

# Improved Networking UX

## For Bare Metal

- Use `nmtui` or `nmcli` from the Live Installer environment
- Pass your live config by invoking the RHCOS installer with the `--copy-network` argument

## For VMware

- The new RHCOS VMware OVA file accepts static networking in the guestinfo fields
- Pass `dracut ip=` syntax to configure static networking through the vSphere web console or API

# Networking and Routing

# SR-IOV Enhancements

## Infiniband Support

- High-throughput low-latency communication standard for high-perf internode message passing
- Configured via SR-IOV Operator and is enabled on Mellanox CX-4/5/6 cards

## IPAM Plug-in: whereabouts

- A CNI plug-in providing IPAM for other (Multus) CNI plugins, e.g. DHCP
- Assigns IP addresses dynamically across the cluster, and **without DHCP**, and allows overlapping IP ranges
- Stores IP address allocations via Kubernetes API

```
{
  "ipam": {
    "type": "whereabouts",
    "range": "<range>",
    "exclude": ["<exclude_part>, ..."],
  }
}
```

## Infiniband Configuration Overview

1. Install SR-IOV operator
2. Create a SriovNetworkNodePolicy CR

```
apiVersion: sriovnetwork.openshift.io/v1
kind: SriovNetworkNodePolicy
metadata:
  name: policy-ib-net-1
  namespace: openshift-sriov-network-operator
spec:
  resourceName: ibnic1
  nodeSelector:
    feature.node.kubernetes.io/network-sriov.capable:
    "true"
  numVfs: 4
  nicSelector:
    vendor: "15b3"
    deviceID: "101b"
    rootDevices: ['0000:19:00.0']
    linkType: ib
    isRdma: true
```

3. Create an SR-IOV network
4. Create a pod with the Infiniband device and network

# Additional Networking Enhancements

## Switch to System OVS

- OVS previously ran in a cluster pod, resulting in existing network flow disruption upon cluster upgrades/restarts
- OVS now runs on the RHCOS host, and remains active during cluster upgrades/restarts
- Requires node reboot to update the OVS version

## Extended serviceNodePortRange (UPI only)

Allows expansion of the default service node port range (30000-32767) for services of type NodePort for customers that implement a large number of node ports, if the corresponding ports are opened at the infrastructure layer..

```
oc patch network cluster -p '{"spec":{"serviceNodePortRange": "30000-33000"}}' --type=merge
```

## Increased Maximum Number of Rules per EgressFirewall Policy

The number of rules in a single EgressFirewall policy was insufficient for some deployments, and was raised from a maximum of 50 to 1000.

# Haproxy Configuration Enhancements

## HTTP Forwarded Header Policy

Use Case: A developer that configures an application-specific proxy that injects X-Forwarded-For and wants an IngressController to pass the header through unmodified for the application's Route.

## Ingress TLS Termination Policy

Ingresses can now specify reencrypt or passthrough policy:

- "reencrypt" decrypts and re-encrypts HTTP traffic when forwarding it.
- "passthrough" passes traffic through without terminating TLS.

## HTTP Cookie Capture

Configure OpenShift to log specific, named HTTP cookies, to ensure security compliance and enable business analytics.

## HTTP Header Capture

Configure OpenShift to log specific HTTP request and response headers for Routes, to ensure security compliance and increase observability.

## HTTP Unique-Id Header

Configure an IngressController to inject an HTTP header with a unique request id into each HTTP request before forwarding the request to the application, so that I can trace HTTP requests and increase observability.

## HTTP Path Rewriting

Support for a Route annotation to configure path rewriting. On incoming requests, the Route's spec.path is replaced with the rewrite target before forwarding.

# Configure IngressController to Use AWS NLB

By default, an IngressController resource will use an AWS Classic Load Balancer when the endpoint publishing strategy is “type: LoadBalancerService” and the Infrastructure resource platform status is “type: AWS”.

Simply by specifying the AWS provider parameter “type: NLB” the IngressController resource will instead use an AWS Network Load Balancer (NLB).

```
apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  name: $MY_INGRESS_CONTROLLER
  namespace: openshift-ingress-operator
spec:
  replicas: 1
  domain: $MY_UNIQUE_INGRESS_DOMAIN
  endpointPublishingStrategy:
    type: LoadBalancerService
    loadBalancer:
      scope: External
      providerParameters:
        type: AWS
    aws:
      type: NLB
```

# Storage

# Storage updates

- No change on support for intree drivers
- CSI Operators
  - CSI Operator Library
  - Move to CSO managing CSI Operators
  - Indicate support of fsGroup
- CSI Capabilities
  - Crash Consistent Snapshots (Tech preview)
    - Fully supported when used with OCS or OpenShift Virtualization
- Enabling OCS via Local Storage Operator
  - Auto-provision of PVs
  - Continuous inventory of local disks

OCP Supported	
AWS EBS	Fibre Channel
Azure File & Disk	HostPath
GCE PD	Local Volume
VMware vSphere Disk	Raw Block
NFS	iSCSI
Supported via OCS	
File , Block, Raw Block, Object	
Supported via OSP	
Cinder	

# OpenShift Container Storage updates

- Encryption support for the entire cluster
- Crash Consistent Snapshots, Clones
- Compression and Replica 2 for block storage
- Object namespaces - single view for multiple object storage buckets.
- Improved bare metal deployment with LSO
  - Auto-provision of PVs
  - Continuous inventory of local disks
  - Easy local drive filtering
- Additional platforms - IBM Z/Power (by IBM)

## Out of the box support

Block, File, Object

## Platforms

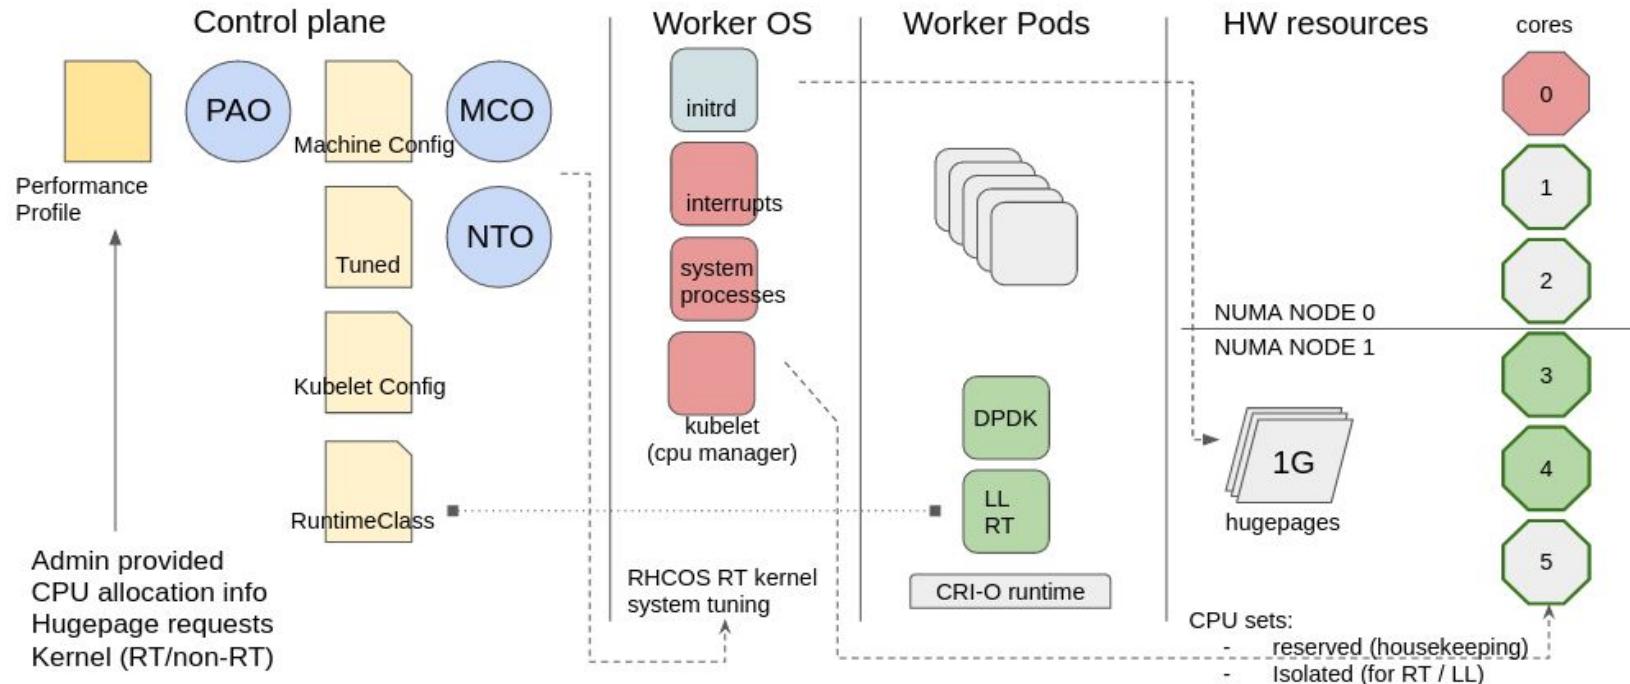

AWS	Azure (Tech Preview)
Bare metal	Google Cloud (Tech Preview)
VMWare	Azure (Tech Preview)
IBM Z/Power (by IBM)	Oct 2020 - RHV (Tech Preview) Nov 2020 - OSP (Tech Preview)

## Deployment modes

Disconnected environment and Proxied environments

# Telco/Edge

# Real Time and Low Latency Workloads (for RAN) with the Performance Addon Operator (PAO)

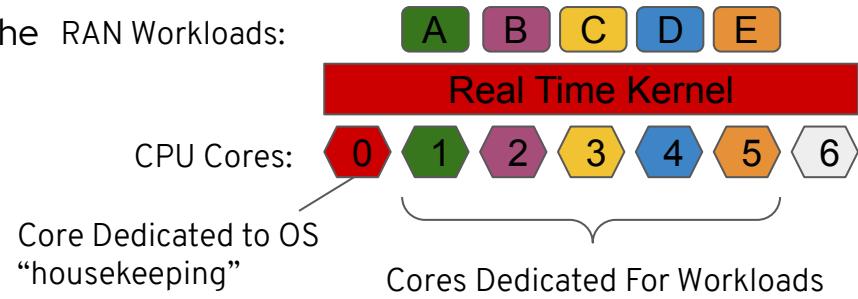

# Real Time Kernel and Low Latency Workloads for RAN

A Real Time Kernel is a Red Hat Enterprise Linux kernel that is modified to maintain **low latency, consistent response time** and **workload determinism**.

This feature allows workloads to run uninterrupted by the Operating System.

- Allow the installation of the Real Time Kernel on RHEL CoreOS nodes.
- Allow the cluster administrator to provide a PerformanceProfile that defines:
  - A number of CPU cores dedicated to “housekeeping” tasks.
  - A number of CPU cores dedicated for workloads (CPU Pinning).
- NUMA alignment for devices, memory and cores used by Low Latency Workloads.

# Cloud-native Network Functions Tests (CNF Tests)

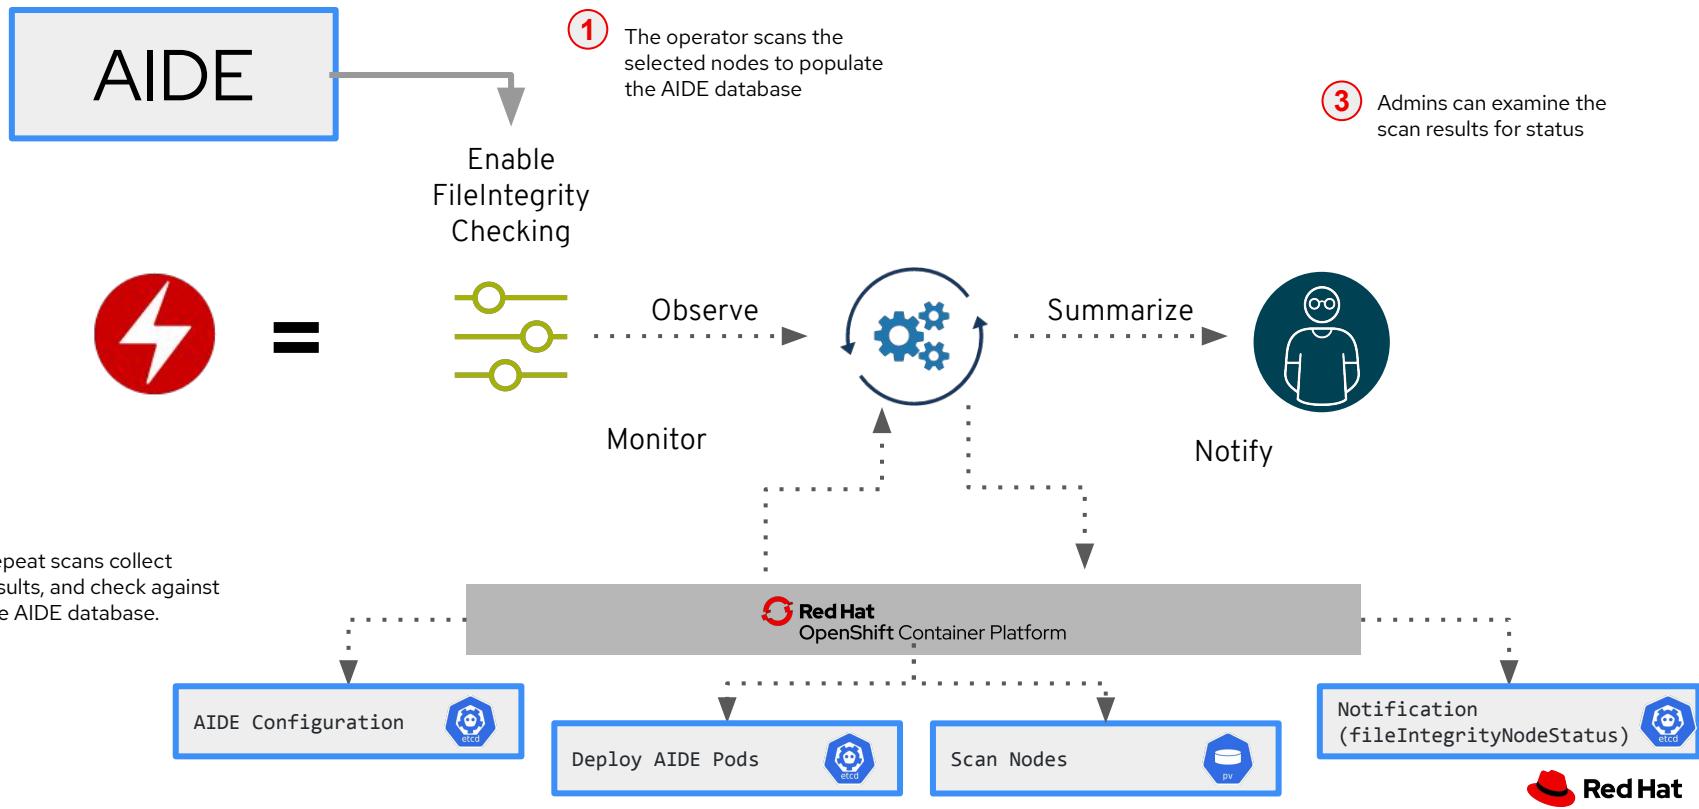

The CNF Tests container image allows service providers to validate that their cluster has been provisioned and configured correctly ready to run CNFs. The documentation resides [here](#).

It validates the following additional performance-related functionality is configured and available on the cluster:

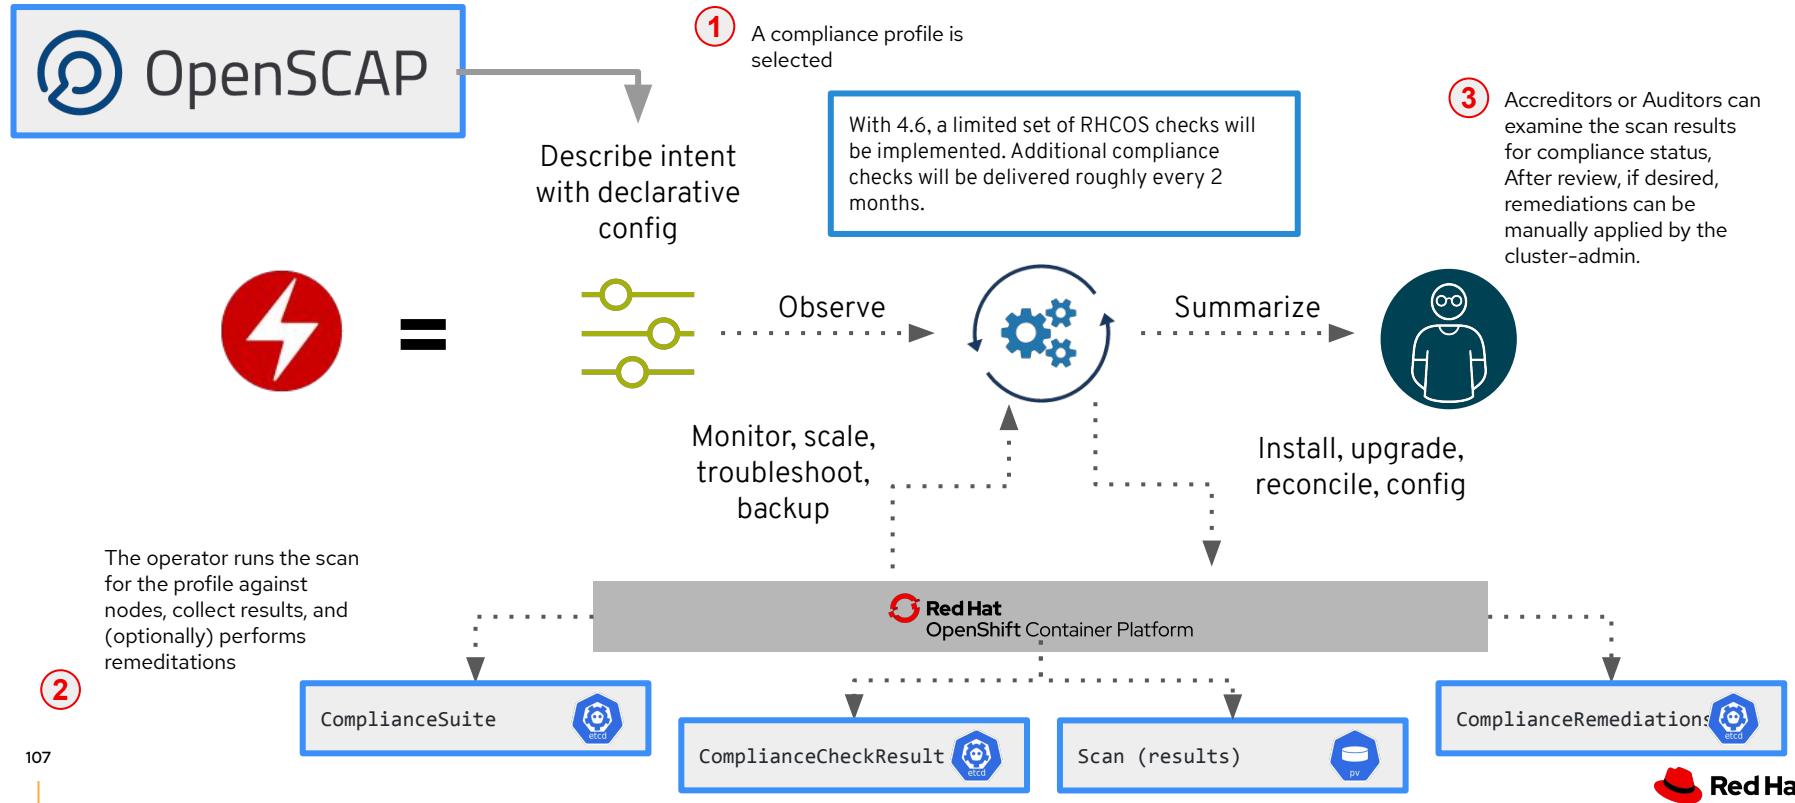

- Precision Time Protocol (PTP)
- Single-root input/output virtualization (SR-IOV)
- Stream Control Transmission Protocol (SCTP)
- Data Plane Development Kit (DPDK)
- Performance AddOn Operator (PAO)

# Security and Compliance

# Openshift File Integrity Operator

# OpenShift Compliance Operator: Declarative Security Compliance

# Declarative Security Compliance

The compliance operator runs in the OpenShift cluster to scan the cluster nodes and the OpenShift platform itself

Builds on existing and proven technologies that are accepted by the industry and used in the RHEL world.

## The operator itself

The operator lets the administrator describe the desired compliance state of a cluster and provides them with an overview of gaps and ways to remediate the gaps.

## OpenSCAP

NIST-certified tool to scan and enforce security policies provided by the content.

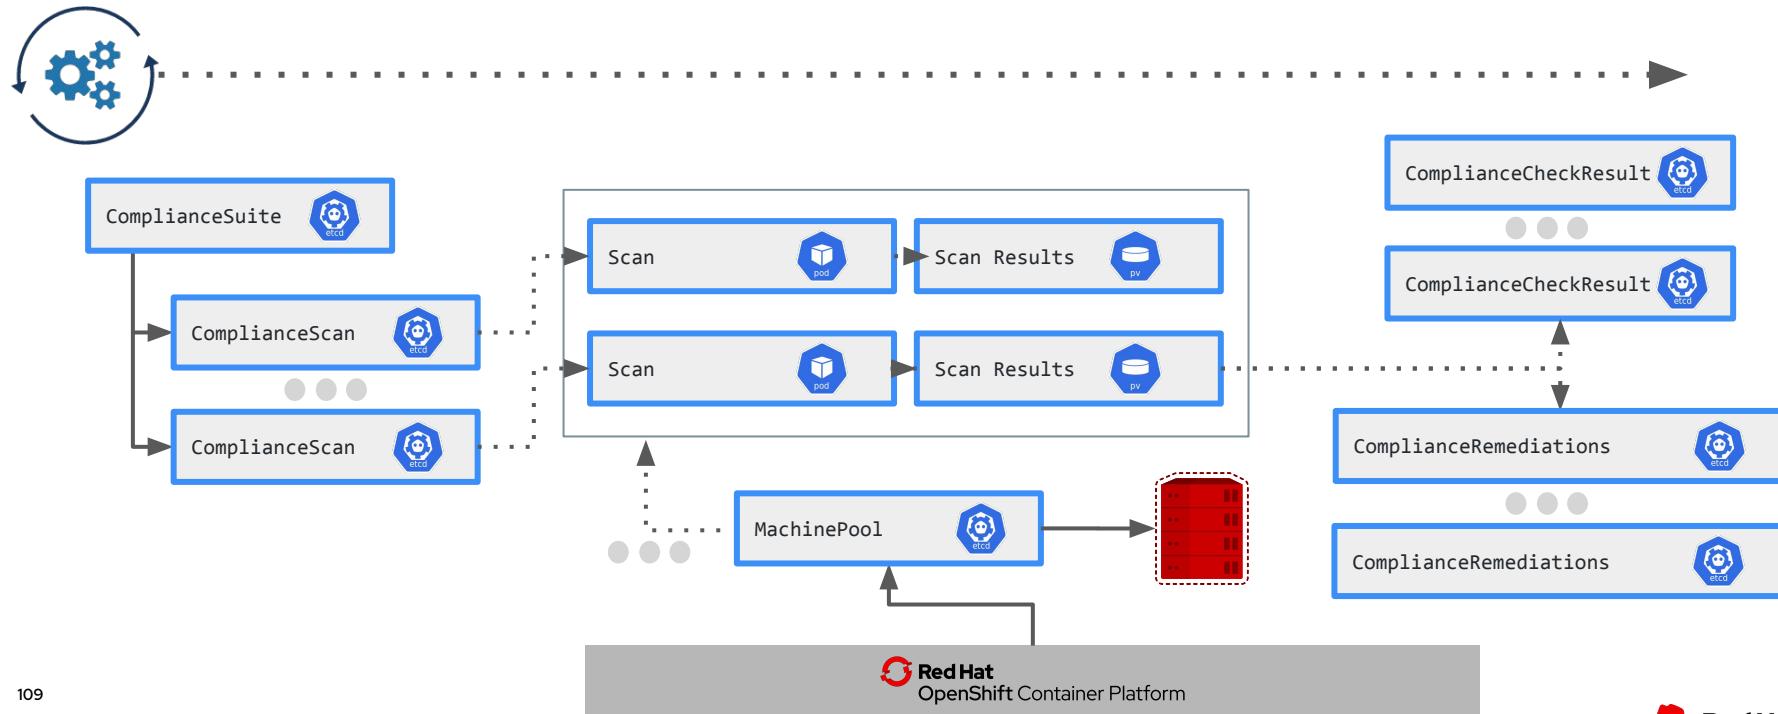

## Compliance Profile Content

The compliance checks themselves are delivered through SCAP content, with a lifecycle independent from the operator or the OpenSCAP scanner

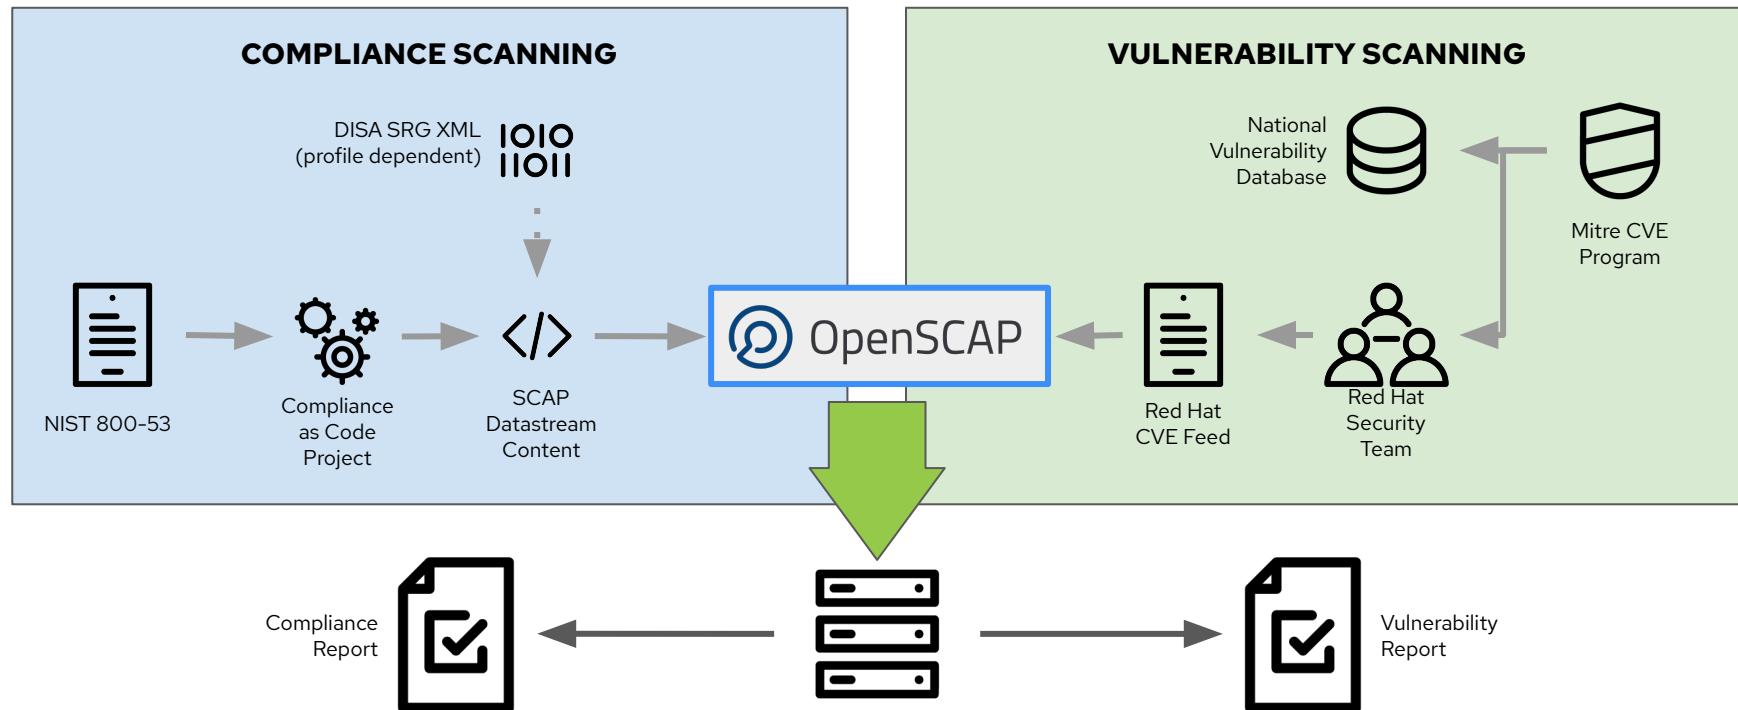

# Under the hood

How the Compliance Operator does its work

# How OpenSCAP Works

## ② OpenSCAP Evaluation Report

### Guide to the Secure Configuration of Red Hat Enterprise Linux 8

with profile [DRAFT] DISA STIG for Red Hat Enterprise Linux 8  
 - This profile contains configuration checks that apply to the [DRAFT] DISA STIG for Red Hat Enterprise Linux 8.

In addition to being applicable to Red Hat Enterprise Linux 8, DISA recognizes this configuration baseline as applicable to the operating system tier of the security baseline for systems based on Red Hat Enterprise Linux 8, such as:

Red Hat Enterprise Linux Server:  
 - Red Hat Enterprise Linux Workstation and Desktop  
 - Red Hat Enterprise Linux for HPC  
 - Red Hat Enterprise Linux for Storage  
 - Red Hat Containers with a Red Hat Enterprise Linux 8 image

The SCAP Security Guide Project  
<https://www.open-scap.org/guides/politics/scap-security-guide>

This document contains security-relevant configuration settings for Red Hat Enterprise Linux 8. It is a rendering of content structured in the extensible Configurations Checklist Description Format (XCCDF) in order to support security automation. The SCAP content is available in the [scap-security-guide package](https://scap-security-guide.googlecode.com) which is developed at <https://www.open-scap.org/politics/scap-security-guide>.

Providing system administrators with such content informs them how to securely configure systems under their control in a variety of environments. Policy makers and security auditors can use this content, along with automated tools, to check for higher-level security control settings, in order to assist them in security baseline creation. This guide is a catalog, not a checklist, and satisfaction of every item is not likely to be possible or sensible in many operational scenarios. However, the XCCDF format enables granular selection and adjustment of settings, and their association with OVAL and OCL content provides an automated checking capability. Transformations of this document, and its associated XCCDF content, are supported by the open-scap project, and can be used to support other security automation tools. The XCCDF content is also designed so that individual items and their checks and controls can be used as baselines. They can be processed, in an automated fashion, with tools that support the Security Content Automation Protocol (SCAP). The DISA 6100, which provides required settings for US Department of Defense systems, is one example of a baseline created from this guidance.

Do not attempt to implement any of the settings in this guide without first testing them in a non-operational environment. The creators of this guidance assume no responsibility whatsoever for its use by other parties, and makes no guarantees, expressed or implied, about its quality, reliability, or any other characteristic.

# Security/Auth Improvements: Customize Audit Config

Control the amount of information that is logged to the node audit logs by choosing the audit log policy profile to use.

- **Default:** Logs only metadata for read and write requests; does not log request bodies. This is the default policy.
- **WriteRequestBodies:** In addition to logging metadata for all requests, logs request bodies for every write request to the API servers (create, update, patch). This profile has more resource overhead than the Default profile.
- **AllRequestBodies:** In addition to logging metadata for all requests, logs request bodies for every read and write request to the API servers (get, list, create, update, patch). This profile has the most resource overhead.

```
apiVersion: config.openshift.io/v1
kind: APIServer
metadata:
...
spec:
  audit:
    profile: WriteRequestBodies
```

# Security/Auth Improvements: Token inactivity timeout for OAuth Server

You can configure OAuth tokens to expire after a set period of inactivity. By default, no token inactivity timeout is set.

Add the `spec.tokenConfig.accessTokenInactivityTimeout` field and set your timeout value:

```
apiVersion: config.openshift.io/v1
kind: OAuth
metadata:
...
spec:
  tokenConfig:
    accessTokenInactivityTimeout: 400s
```

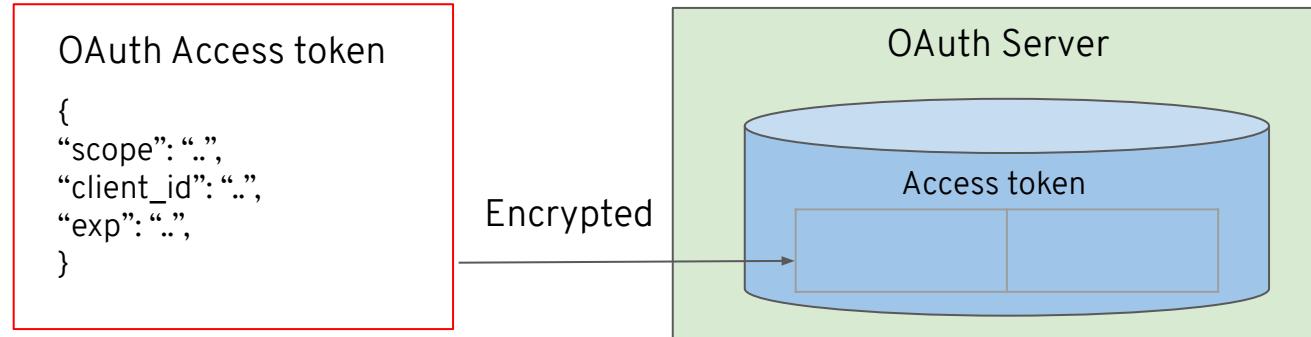

## Example output

```
error: You must be logged in to the server (Unauthorized)
```

# Security/Auth Improvements: Secure OAuth Resource Storage

OAuth access token and OAuth authorize token object names are now stored as non-sensitive object names. Previously, secret information was used as the OAuth access token and OAuth authorize token object names. When etcd is encrypted, only the value is encrypted, so this sensitive information was not encrypted.

*If you are upgrading your cluster to OpenShift Container Platform 4.6, old tokens from OpenShift Container Platform 4.5 will still have the secret information exposed in the object name. By default, the expiration for tokens is 24 hours, but this setting can be changed by administrators. Sensitive data can still be exposed until all old tokens have either expired or have been deleted by an administrator.*

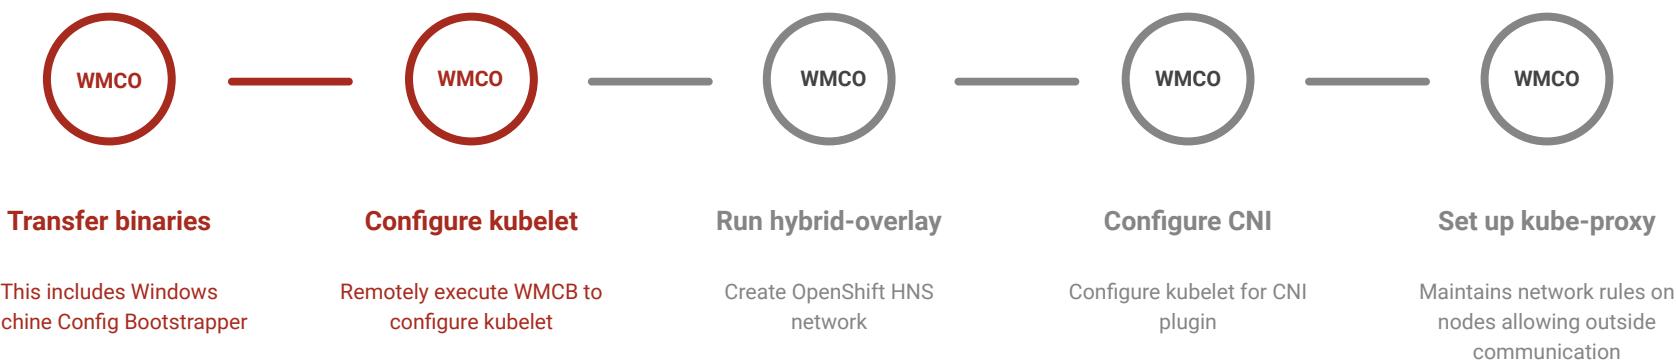

# Multi-Arch & Windows

# Windows Community Operator

- Community distribution of the Windows Machine Config Operator will be available in mid to late October
- The Windows Machine Config Operator is the entry point for OpenShift customers who want to run Windows workloads on their clusters.
- The intent of this feature is to allow a cluster administrator to add a Windows compute node as a day 2 operation with a prescribed configuration to an installer provisioned OpenShift 4.6 cluster and enable scheduling of Windows workloads.
- Prerequisite: OpenShift 4.6+ cluster configured with hybrid OVN Kubernetes networking.
- Tested on AWS and Azure. vSphere CI tests on-going
- Red Hat certified operator will be generally available in December

	<b>Community Operator</b>	<b>Red Hat Operator</b>
Location	In Cluster OperatorHub	Red Hat Marketplace
Available date	Mid Oct	Mid Dec
Platforms supported	AWS, Azure	AWS, Azure, vSphere (possibly)
Refresh cycle	Every 1-2 months	Every OCP Y stream

# Windows Machine Config Operator (WMCO) workflow

# Multi-architecture updates

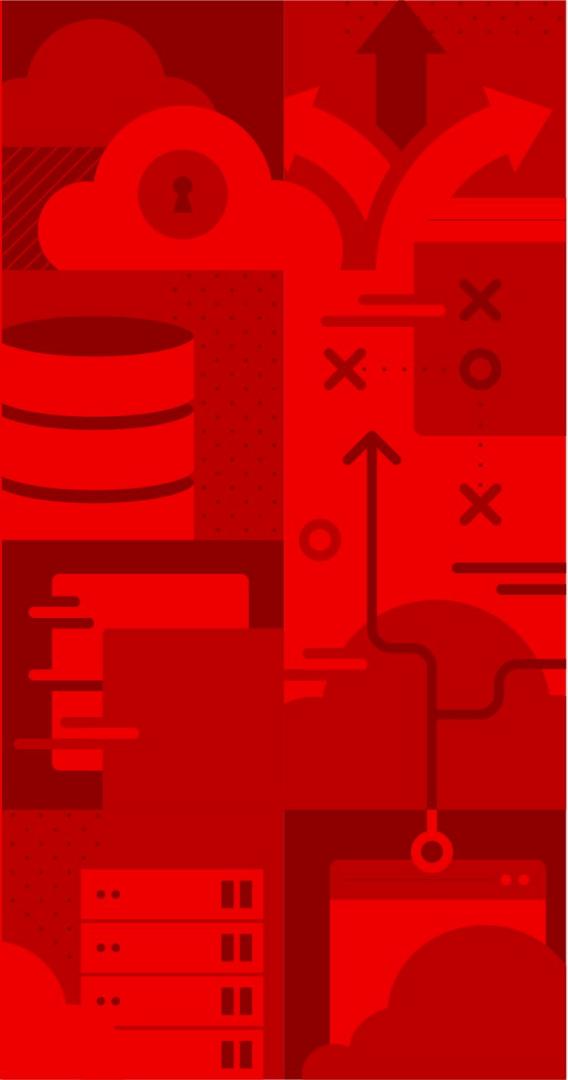

- Align IBM Power and IBM Z GA with x86
- Storage being expanded
