Day 1 Installation

OPENSHIFT CONTAINER PLATFORM

Full Stack Automation

Simplified opinionated “Best Practices” for cluster provisioning

Fully automated installation and updates including host container OS.

Red Hat
Enterprise Linux
CoreOS

Pre-existing Infrastructure

Customer managed resources & infrastructure provisioning

Plug into existing DNS and security boundaries

Red Hat
Enterprise Linux
CoreOS

Red Hat
Enterprise Linux

HOSTED OPENSHIFT

Azure Red Hat OpenShift

Deploy directly from the Azure console. Jointly managed by Red Hat and Microsoft Azure engineers.

OpenShift Dedicated

Get a powerful cluster, fully Managed by Red Hat engineers and support.

Kubernetes Machine API Operator

Using Kubernetes To Provision And Scale Clusters

The screenshot shows the Red Hat OpenShift web console interface. The left sidebar is a navigation menu with the following items: Workloads, Networking, Storage, Builds, Monitoring, Administration (with sub-options: Cluster Settings, Namespaces, Nodes, Machine Deployments, Machine Sets, and Machines), Service Accounts, Roles, Role Bindings, Resource Quotas, Limit Ranges, and CRDs. The 'Machines' item under 'Administration' is currently selected. The main content area displays a table titled 'Machines' with columns: NAME, NAMESPACE, REGION, and AVAILABILITY ZONE. The table lists several machine objects, each with a three-dot menu icon. A search bar at the top right of the table says 'Filter Machines by name...'. The URL in the browser is 'console-openshift-console.apps.robszumski-0100.cloud.robszumski.com'.

The screenshot shows the Red Hat OpenShift web console interface. The left sidebar is identical to the one in the first screenshot. The main content area shows 'Machine Set Details' for a machine set named 'robszumski-0100-worker-us-east-2a'. It includes tabs for Overview, YAML, and Machines. The Overview tab displays a large block of YAML code for the machine set's configuration. The URL in the browser is 'console-openshift-console.apps.robszumski-0100.cloud.robszumski.com'.

Day 2 Configuration

Global Configuration

You complete most of the cluster configuration and customization after you deploy your OpenShift Container Platform cluster.

Change via Cluster Settings screen

Once you have discovered your desired settings (prev. slide), changes can be made via Console or CLI.

Operators apply these updates

One or more Operators are responsible for propagating these settings through the infrastructure

- Identity Provider
- Ingress Controller
- Logging, Metrics

The screenshot shows the Red Hat OpenShift Container Platform web interface. The top navigation bar includes the Red Hat logo, the platform name, and a user dropdown set to 'kube:admin'. The left sidebar is a dark-themed navigation menu with sections for Home, Catalog, Workloads, Networking, Storage, Builds, Monitoring, Compute (with sub-options for Nodes, Machines, Machine Sets, Machine Configs, Machine Config Pools), Administration (with sub-options for Cluster Status, Cluster Settings, Namespaces, Service Accounts, Roles, Role Bindings, Resource Quotas, Limit Ranges, Custom Resource Definitions), and Infrastructure (with sub-options for Ingress, Network, OAuth, Project, and Scheduler). The main content area is titled 'Cluster Settings' and contains a table listing various configuration resources. Each resource row includes the resource name, a brief description, and an 'Edit YAML' button. The 'Cluster Settings' row is currently selected, indicated by a blue underline.

Smarter Software Updates

No downtime for well behaving apps

Applications with multiple replicas, using liveness probes, health checks and taints/tolerations
Node Pools with more than one worker and slack resources

Maintenance window for entire cluster

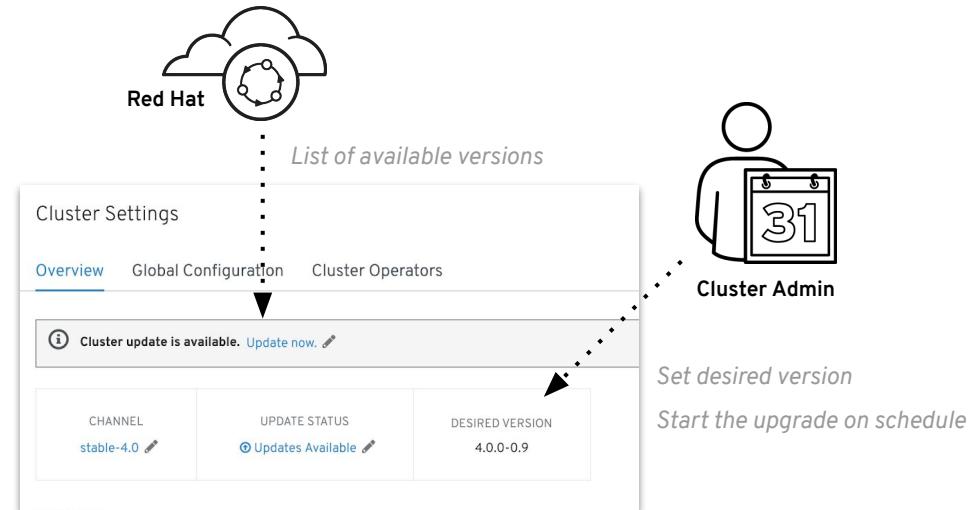

No need for separate windows for each component

Upgrade runs completely on the cluster

No more long running processes on a workstation

Constant health checking from each Operator

Operators are constantly looking for incompatibilities and issues that might arise

Fixes to Kubernetes vulnerabilities

The screenshot shows a web page from Red Hat's security portal. The URL is <https://access.redhat.com/security/vulnerabilities/3716411>. The page title is "Kubernetes privilege escalation and access to sensitive information in OpenShift products and services - CVE-2018-1002105". The public date is December 3 2018 at 12:00 PM, and it was updated on December 6 2018 at 7:44 PM. The status is "Resolved" (green circle with checkmark) and the impact is "Critical" (red circle with exclamation mark). Below the main title, there are tabs for "Overview", "Impact", "Diagnose", and "Resolve", with "Resolve" being the active tab. The "Take Action" section contains a message about updating affected products and a note for OpenShift Dedicated customers.

Security > Vulnerability Responses > Kubernetes privilege escalation and access to sensitive information in OpenShift products and services - CVE-2018-1002105

Public Date: December 3 2018 at 12:00 PM
Updated December 6 2018 at 7:44 PM - English ▾

STATUS Resolved IMPACT Critical

Overview Impact Diagnose Resolve

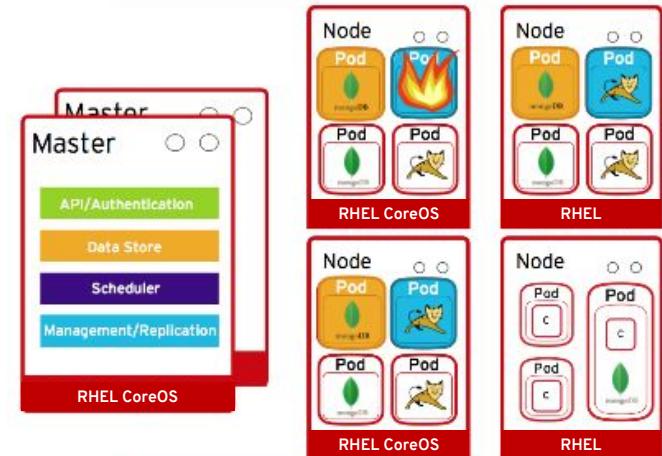

Take Action

Customers running affected versions of Red Hat products are strongly recommended to update them as soon as errata are available.

OpenShift Online (Starter, Pro) have been remediated. OpenShift Dedicated customers should speak with their support contact to confirm the status/schedule for these fixes.

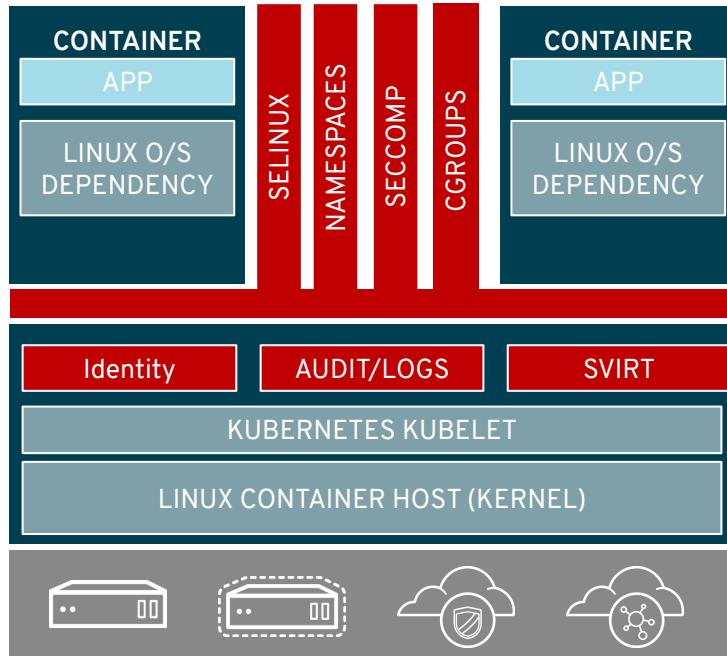

Securing the container platform

- Configuration and lifecycle management
- **Host & runtime security**
- Identity and Access Management
- Data at rest, data in transit
- Logging, Monitoring, Metrics
- Audit and Compliance

Container security starts with Linux security

- Security in the RHEL host applies to the container
- RHEL enables container multitenancy
- SELinux and Kernel Namespaces are the one-two punch no one can beat
- Protects not only the host, but containers from each other
- RHEL CoreOS provides minimized attack surface

Red Hat Enterprise Linux CoreOS

The Immutable Container Optimized Operating System

OPENSHIFT 4

OPENSHIFT PLATFORM

OPERATING SYSTEM

RED HAT[®]
ENTERPRISE
LINUX CoreOS

Role in OpenShift Ecosystem

- Versioned and validated for specific OpenShift version
- Required for masters. RHEL option for workers
- User space read-only

Managed by the OpenShift Cluster

- Considered a member of an OpenShift Deployment
- Configuration managed by the Machine Config Operator
 - Container runtime
 - Kubelet configuration
 - Authorized container registries
 - SSH Configuration

cri-o

A lightweight, OCI-compliant container runtime

Optimized for
Kubernetes

Any OCI-compliant
container from any
OCI registry
(including docker)

Improve Security and
Performance at scale

[CRI - the Container Runtime Interface](#)

[OpenShift 4 defaults to CRI-O](#)

[Red Hat contributes CRI-O to the Cloud Native Computing Foundation](#)

Runtime security policies

SCC (Security Context Constraints)

Allow administrators to control permissions for pods

Restricted SCC is granted to all users

By default, no containers can run as root

Admin can grant access to privileged SCC

Custom SCCs can be created

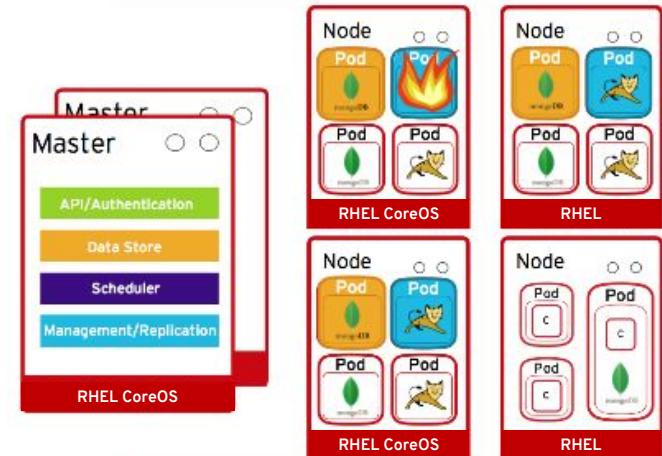

```
$ oc describe scc restricted
Name:                           restricted
Priority:                       <none>
Access:
  Users:                         <none> ①
  Groups:                        system:authenticated ②
Settings:
  Allow Privileged:              false
  Default Add Capabilities:     <none>
  Required Drop Capabilities:   KILL,MKNOD,SYS_CHROOT,SETUID,SETGID
  Allowed Capabilities:         <none>
  Allowed Seccomp Profiles:    <none>
  Allowed Volume Types:        configMap,downwardAPI,emptyDir,persistentVolumeClaim,projected,
  Allow Host Network:           false
  Allow Host Ports:             false
  Allow Host PID:               false
  Allow Host IPC:               false
  Read Only Root Filesystem:    false
  Run As User Strategy: MustRunAsRange
    UID:                          <none>
    UID Range Min:               <none>
    UID Range Max:               <none>
  SELinux Context Strategy: MustRunAs
    User:                         <none>
    Role:                         <none>
    Type:                          <none>
    Level:                         <none>
  FSGroup Strategy: MustRunAs
    Ranges:                        <none>
  Supplemental Groups Strategy: RunAsAny
    Ranges:                        <none>
```

① Lists which users and service accounts the SCC is applied to.
② Lists which groups the SCC is applied to.

Securing the container platform

- Configuration and lifecycle management
- Host & runtime security
- **Identity and Access Management**
- Data at rest, data in transit
- Logging, Monitoring, Metrics
- Audit and Compliance

Identity and access management

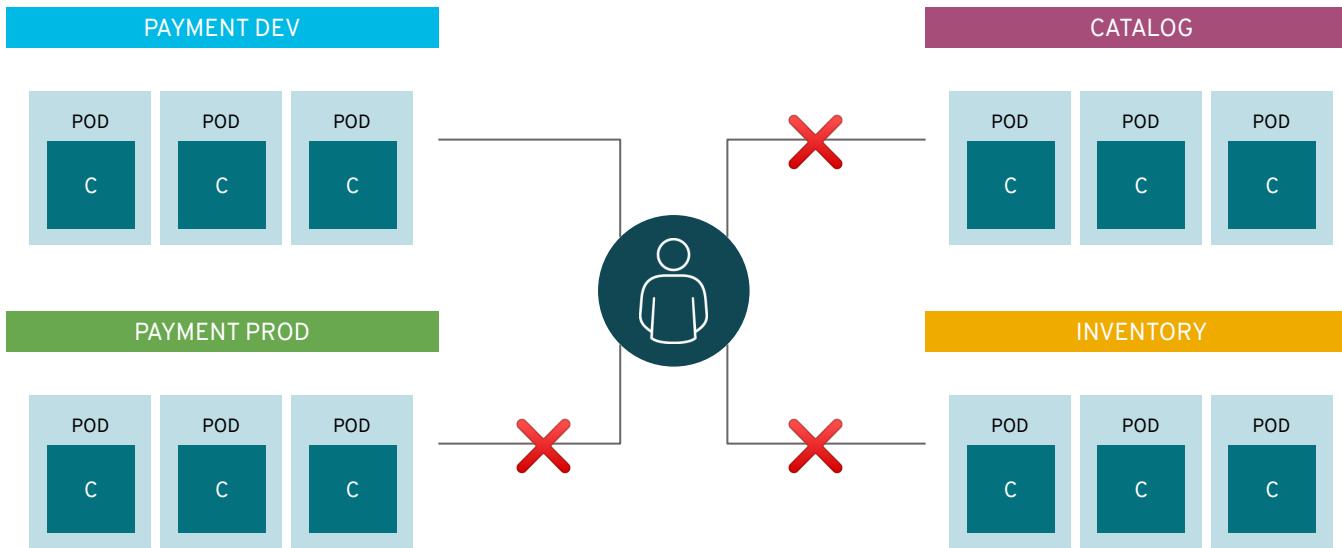

OpenShift includes an OAuth server, which does three things:

- Identifies the person requesting a token, using a configured identity provider
- Determines a mapping from that identity to an OpenShift user
- Issues an OAuth access token which authenticates that user to the API
[Managing Users and Groups in OpenShift](#)
[Configuring Identity Providers](#)

Supported Identity Providers include

- Keystone
- LDAP
- GitHub
- GitLab
- GitHub Enterprise (new with 3.11)
- Google
- OpenID Connect
- Security Support Provider Interface (SSPI) to support SSO flows on Windows (Kerberos)

Projects isolate applications across teams, groups and departments

Restrict access by need to know

Role based authorization

- Project scope & cluster scope available
- Matches request attributes (verb,object,etc)
- If no roles match, request is denied (deny by default)
- Operator- and user-level roles are defined by default
- Custom roles are supported

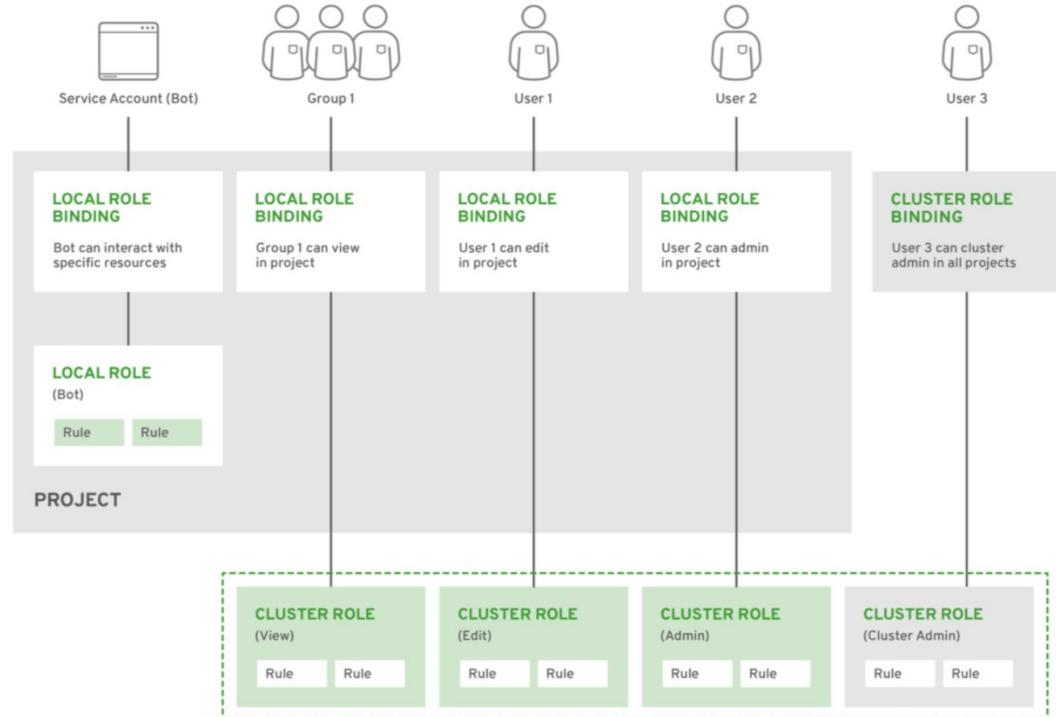

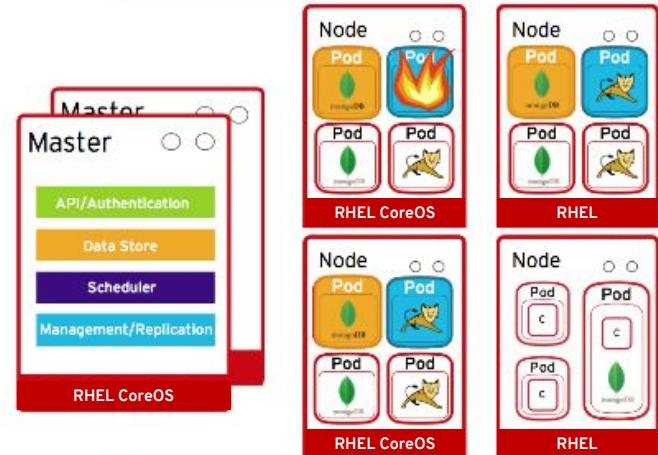

Figure 12 - Authorization Relationships

Securing the container platform

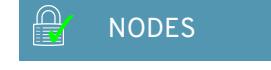

- Configuration and lifecycle management
- Host & runtime security
- Identity and Access Management
- **Data at rest, data in transit**
- Logging, Monitoring, Metrics
- Audit and Compliance

Certificate management

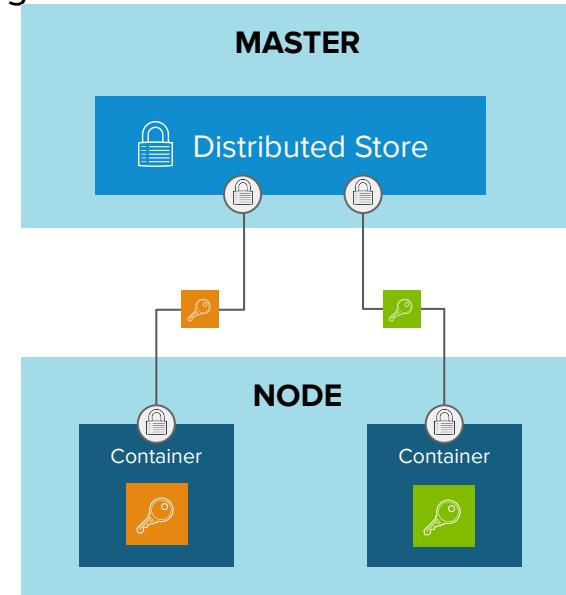

- Certificates are used to provide secure connections to
 - master and nodes
 - Ingress controller and registry
 - etcd
- Certificate rotation is automated
- Optionally configure external endpoints to use custom certificates
- For example:

[Requesting and Installing Let's Encrypt Certificates for OpenShift 4](#)

Secrets management

- Secure mechanism for holding sensitive data e.g.
 - Passwords and credentials
 - SSH Keys
 - Certificates
- Secrets are made available as
 - Environment variables
 - Volume mounts
 - Interaction with external systems (e.g. vaults)
- Encrypted in transit and at rest
 - Encrypt the etcd datastore
 - Encrypt RHCOS volumes
- Never rest on the nodes

Volume Encryption

Network Bound Disk Encryption

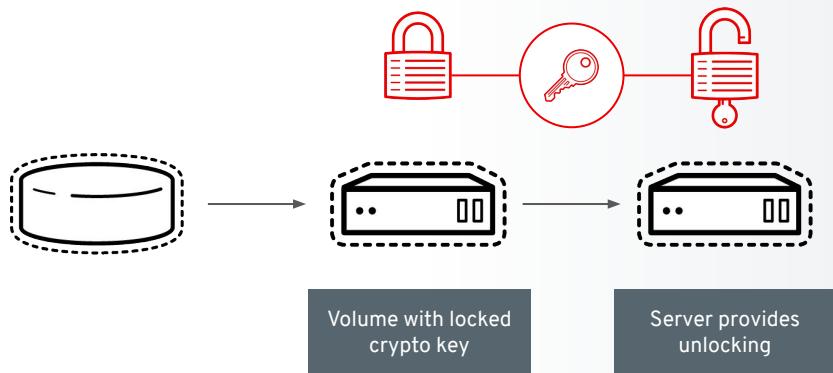

- Provides encryption for local storage
- Addresses disk/image theft
- Platform/cloud agnostic implementation
- TPM/vTPM (v2) and Tang endpoints for automatic decryption

Attached storage

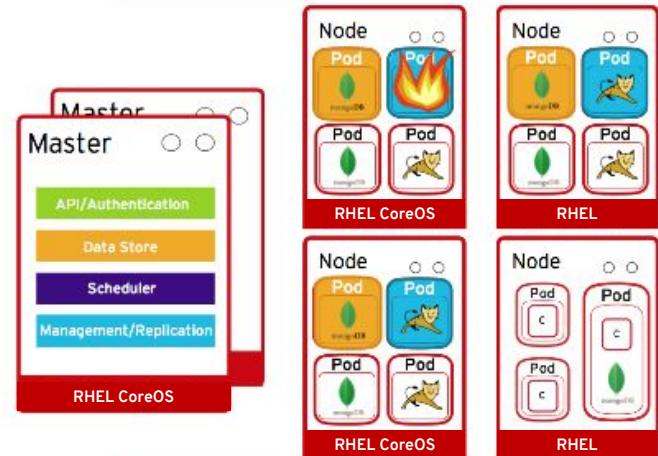

Secure storage by using

- SELinux access controls
- Secure mounts
- Supplemental group IDs for shared storage
- Network bound disk encryption

Securing the container platform

- Configuration and lifecycle management
- Host & runtime security
- Identity and Access Management
- Data at rest, data in transit
- **Logging, Monitoring, Metrics**
- Audit and Compliance

Cluster log and audit management

Install the Elasticsearch and Cluster Logging Operators

- EFK stack aggregates logs for hosts and applications
 - Elasticsearch: a search and analytics engine to store logs
 - Fluentd: gathers logs and sends to Elasticsearch.
 - Kibana: A web UI for Elasticsearch.
- Access control
 - Cluster administrators can view all logs
 - Users can only view logs for their projects
 - Central Audit policy configuration
- API server events are automatically audited
- Logging pipelines collect API server and host audit logs as well as cluster and application logs for forwarding to the SIEM of your choice

Create Operator Subscription

Keep your service up to date by selecting a channel and approval strategy. The strategy determines either manual or automatic updates.

Installation Mode *

```

Introduce new log forwarding API

Abstract Fluentd configuration by introduce new log forwarding API to improve support and experience for customers.

- Introduce a new, cluster-wide *ClusterLogForwarder* CRD (API) that replaces needs to configure log forwarding via Fluentd ConfigMap.
- The API helps to reduce probability to misconfigure Fluentd and helps bringing in more stability into the Logging stack.
- Route logs based on their source type (infra, app or audit logs) and filter them further by namespaces.
- Collecting and forwarding audit logs
- With the API, we also introduce the following endpoint improvements to bring more value on to the table:
 - Improved syslog support adding TLS for secure communication + support for the newest standard (RFC5424).
 - Kafka support.

Forward logs to different systems based on their "inputSource".

```
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogForwarder"
spec:
  outputs:
    - name: MyLogs
      type: Syslog
      syslog:
        Facility: Local0
        url: localstore.example.com:9200
  pipelines:
    - inputs: [Infrastructure, Application, Audit]
      outputs: [MyLogs]
```

Cluster monitoring

Cluster monitoring is installed by default

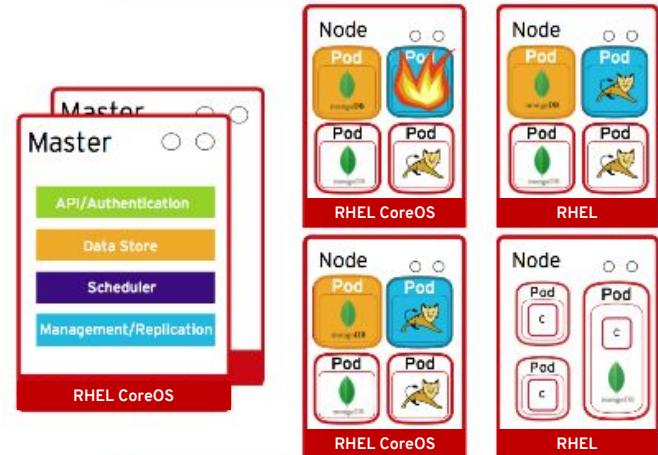

- Exposes resource metrics for Horizontal Pod Autoscaling (HPA) by default
 - HPA based on custom metric is tech preview
- No manual etcd monitoring configuration anymore
- New screens for managing Alerts & Silences
- More metrics available for troubleshooting purposes (e.g. HAProxy)
- Configuration via ConfigMaps and Secrets

The screenshot shows the Red Hat OpenShift Container Platform web interface. The left sidebar has a dark theme with the Red Hat logo at the top. It includes sections for OperatorHub, Operator Management, Workloads, Networking, Storage, Builds, Monitoring (which is currently selected), Alerts, Silences, Metrics, Dashboards, Compute, and Nodes. The Monitoring section is expanded, showing sub-options for Alerts, Silences, Metrics, and Dashboards. The main content area is titled "Alerts" and includes a sub-link to "Alertmanager UI". Below this, a message states: "Alerts help notify you when certain conditions in your environment are met. Learn more about how alerts are triggered." There are four filter buttons: "12 Firing" (highlighted in blue), "0 Silenced", "0 Pending", and "77 Not Firing". A "Select All Filters" button is also present. The alert list displays several entries, each with a blue circular icon followed by the alert name and a red bell icon indicating it is firing. The columns for each alert are NAME, STATE, and LAST FIRED. The first three alerts are for CPU throttling, and the last two are for KubeDeploymentReplicasMismatch and KubePodCrashLooping.

NAME	STATE	LAST FIRED
AL CPUThrottlingHigh	Firing	Since 29 Apr 2023, 11:52 AM
AL CPUThrottlingHigh	Firing	Since 2 May 2023, 6:47 AM
AL CPUThrottlingHigh	Firing	Since 29 Apr 2023, 11:52 AM
AL KubeDeploymentReplicasMismatch	Firing	Since 2 May 2023, 1:34 PM
AL KubePodCrashLooping	Firing	Since 29 Apr 2023, 2:52 PM

Securing the container platform

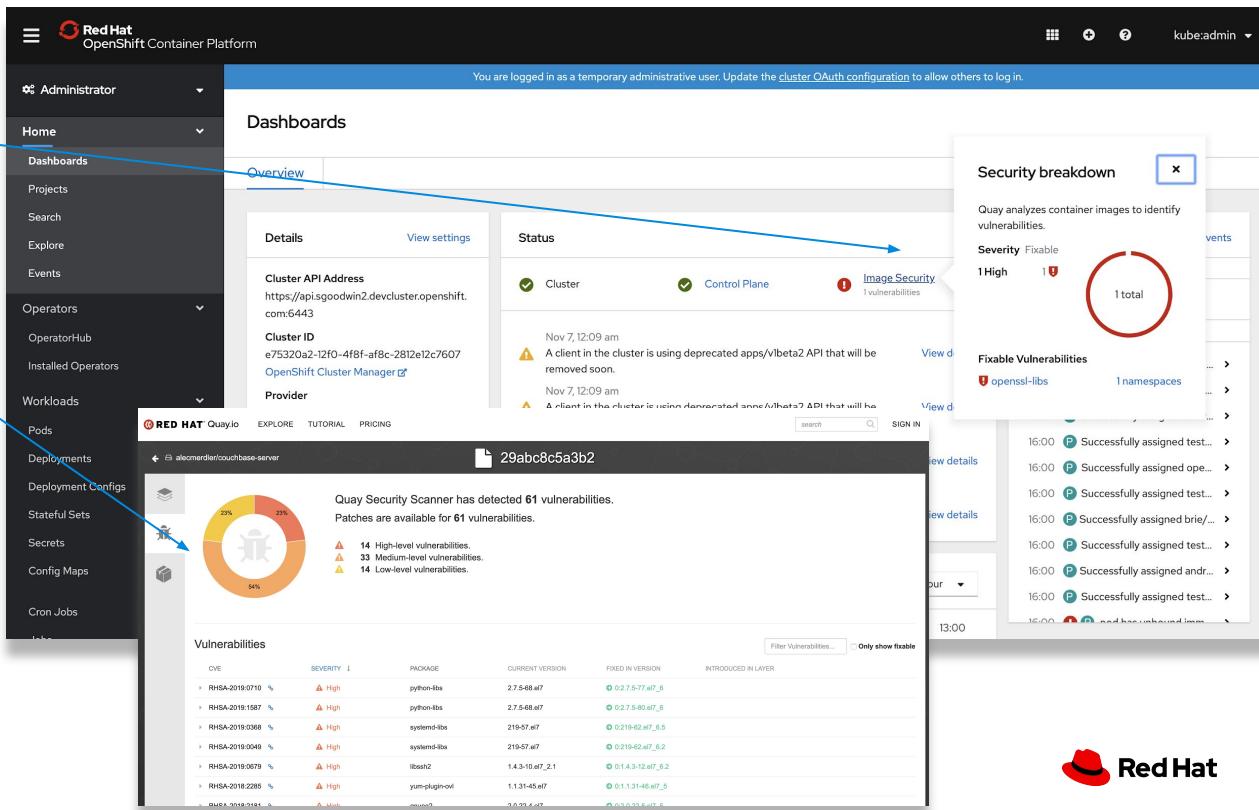

- Configuration and lifecycle management
- Host & runtime security
- Identity and Access Management
- Data at rest, data in transit
- Logging, Monitoring, Metrics
- **Audit and Compliance**

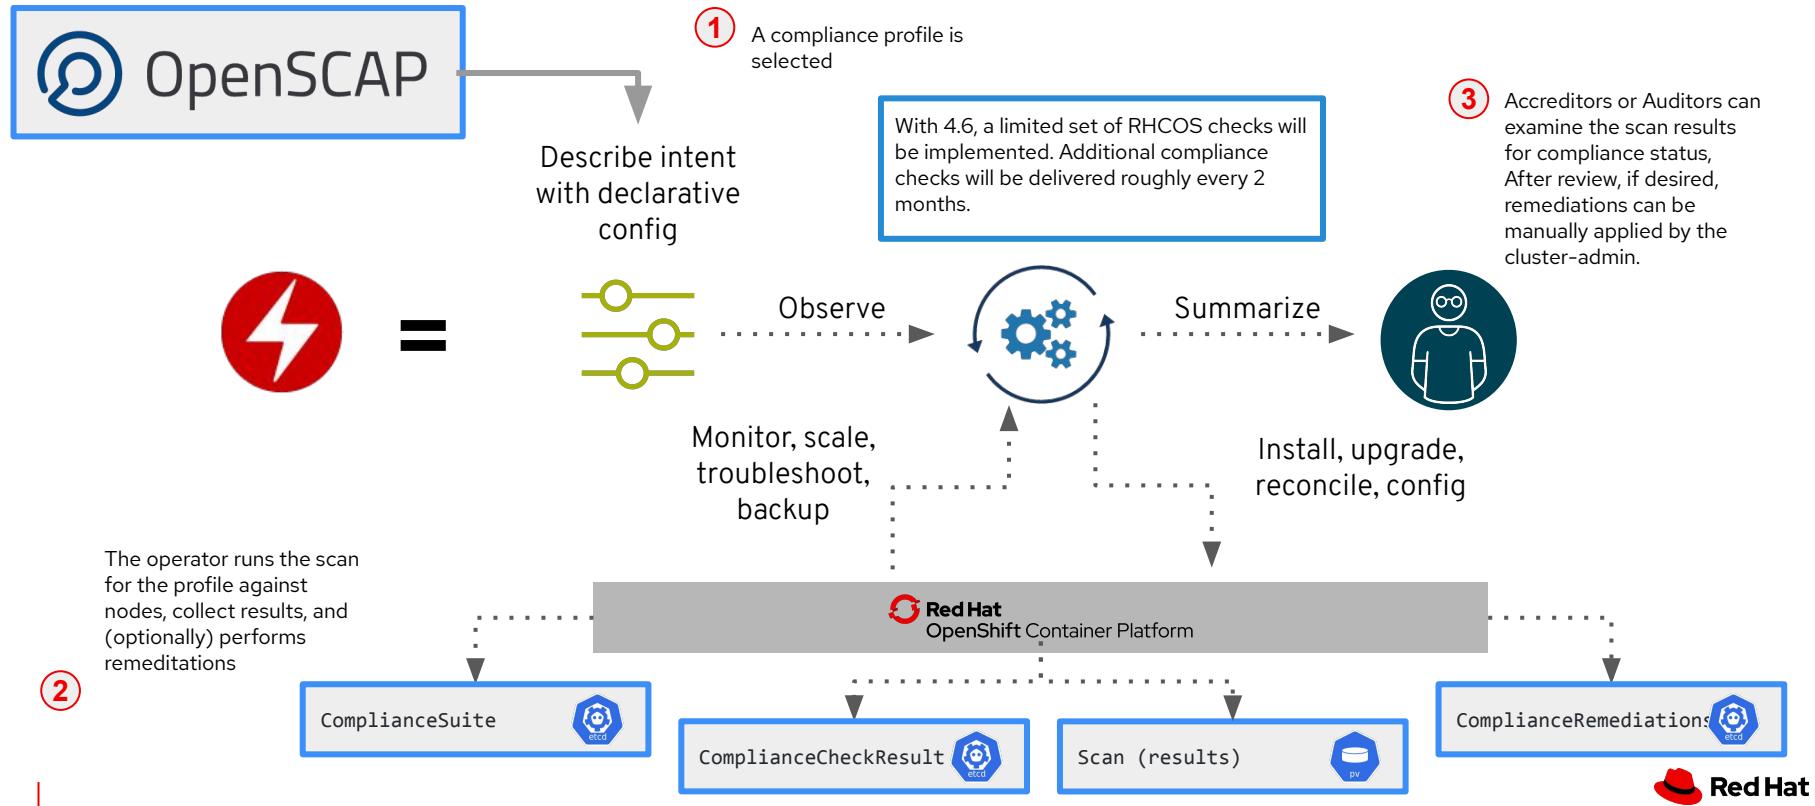

View Security Vulnerabilities with the Quay Operator

**See all your Container
Vulnerabilities right from the
Console Dashboard**

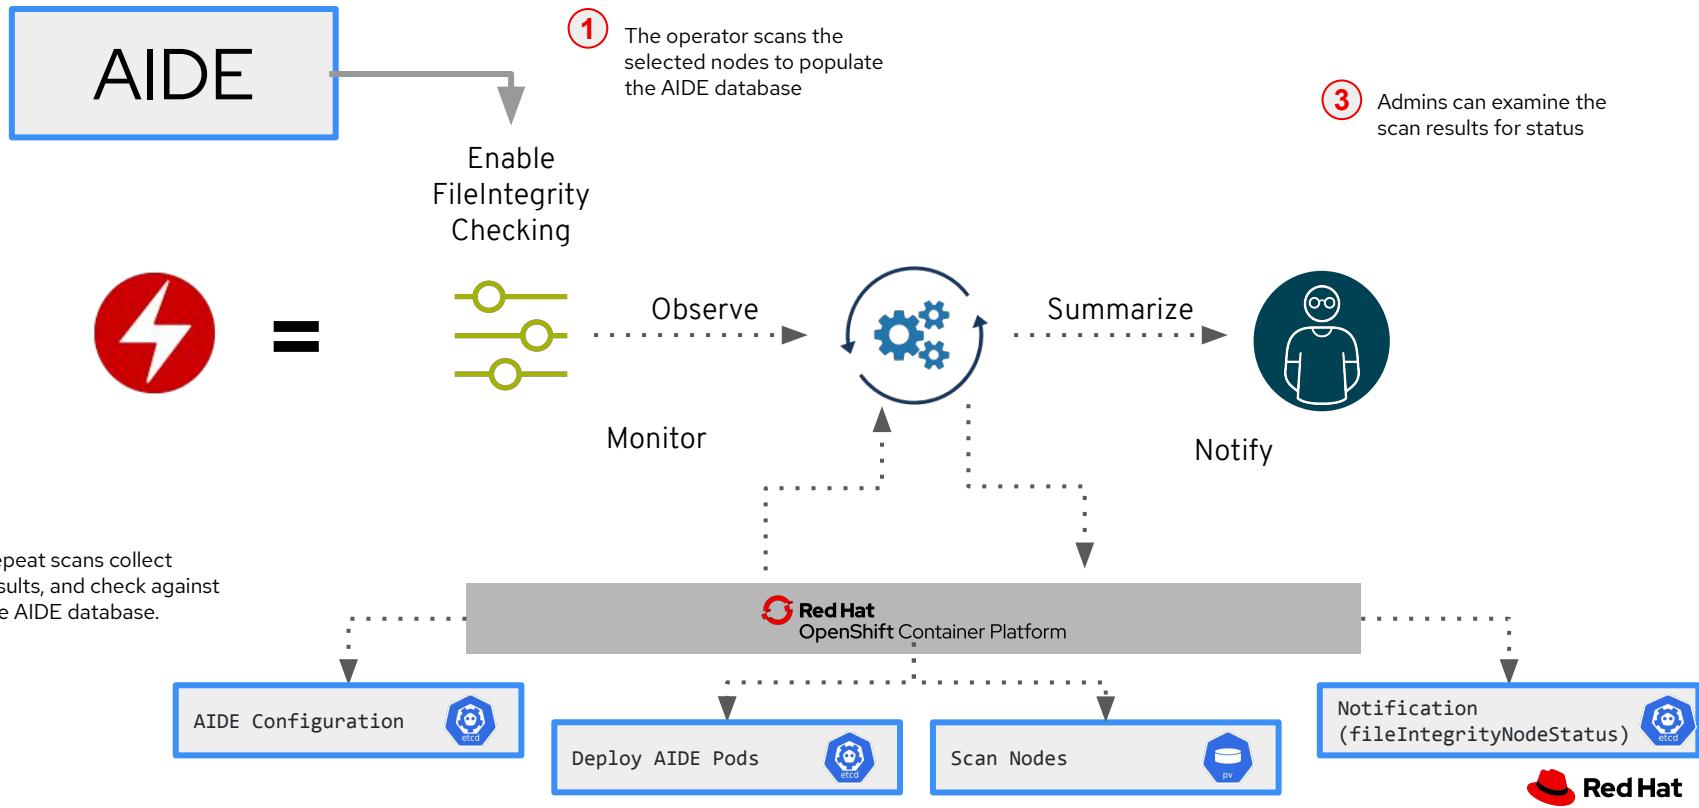

- Link out to **Red Hat Quay** for more in depth information
 - The Quay Operator supports both **On-premise and External** Quay Registries
 - Currently uses **Clair for Security Scan**; Planning to expand to other Vendors(TwistLock, Aqua, e.g.)
 - *Only works for images managed by Quay*

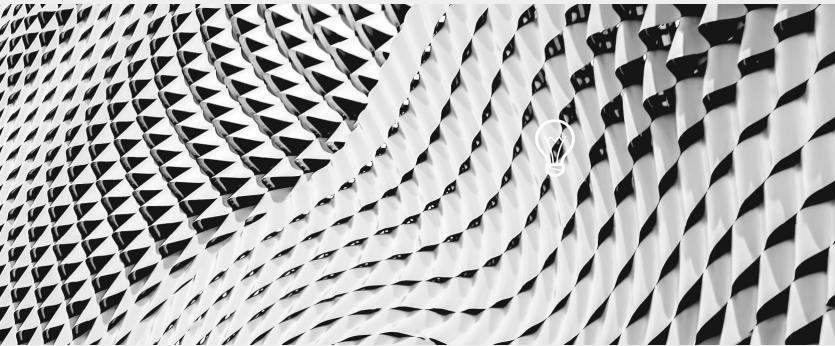

Openshift Compliance Operator: Declarative Security Compliance

Openshift File Integrity Operator

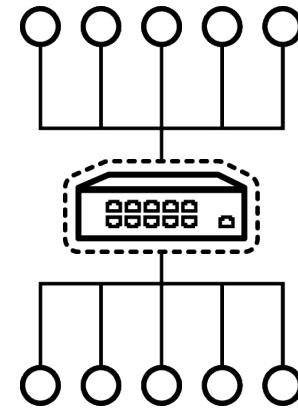

DEFEND THE NETWORK

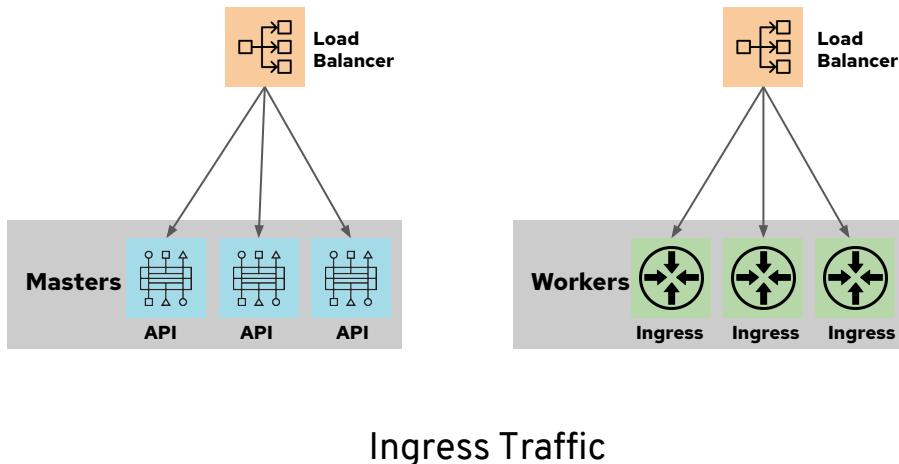

OpenShift networking

- Built-in internal DNS to reach services by name
- OpenShift follows the Kubernetes Container Networking Interface (CNI) plug-in model
- Software Defined Networking (SDN) for a unified cluster network to enable pod-to-pod communication
- Network Policies to isolate applications from other applications within a cluster
- Service Mesh provides advanced capabilities for managing service to service communication
- Multiple options for ingress and egress control

External Access to Cluster Resources

- Two primary entry points into OpenShift
 - API
 - Ingress/Router
- Proper DNS entries must be configured
- Additional ingress types available
 - NodePort (requires additional port resources)
 - LoadBalancer

Ingress NodePortService

Some admins don't want OpenShift to manage a cloud load balancer and DNS for their IngressControllers.

They may want IngressControllers to be exposed through node ports to enable custom integration with a front-end load balancing solution.

The NodePortService endpoint publishing strategy publishes the Ingress Controller using a [Kubernetes NodePort service](#), which enables:

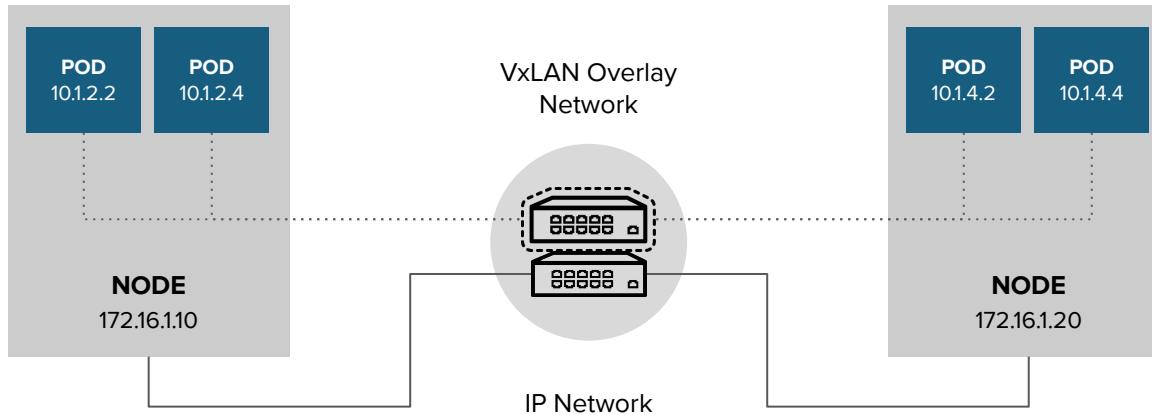

- alternate forms of ingress for better support of bare metal deployments
- use cases requiring more than one instance of the HAProxy router per node

```
apiVersion: v1
kind: Service
metadata:
  name: router-default
  namespace: openshift-ingress
  annotations:
    operator.openshift.io/node-port-service-for: default
spec:
  type: NodePort
  externalTrafficPolicy: Local
  ports:
  - name: http
    port: 80
    protocol: TCP
    targetPort: http
  - name: https
    port: 443
    protocol: TCP
    targetPort: https
  selector:
    ingresscontroller.operator.openshift.io/deployment-ingresscontroller: default
```

Routes vs Ingress

Feature	Ingress	Route
Standard Kubernetes object	X	
External access to services	X	X
Persistent (sticky) sessions	X	X
Load-balancing strategies (e.g. round robin)	X	X
Rate-limit and throttling	X	X
IP whitelisting	X	X
TLS edge termination	X	X
TLS re-encryption	X	X
TLS passthrough	X	X
Multiple weighted backends (split traffic)		X
Generated pattern-based hostnames		X
Wildcard domains		X

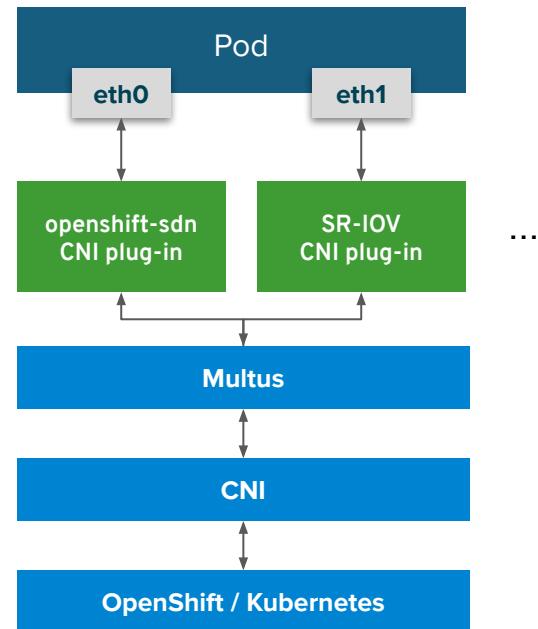

OpenShift pod to pod networking

Multus

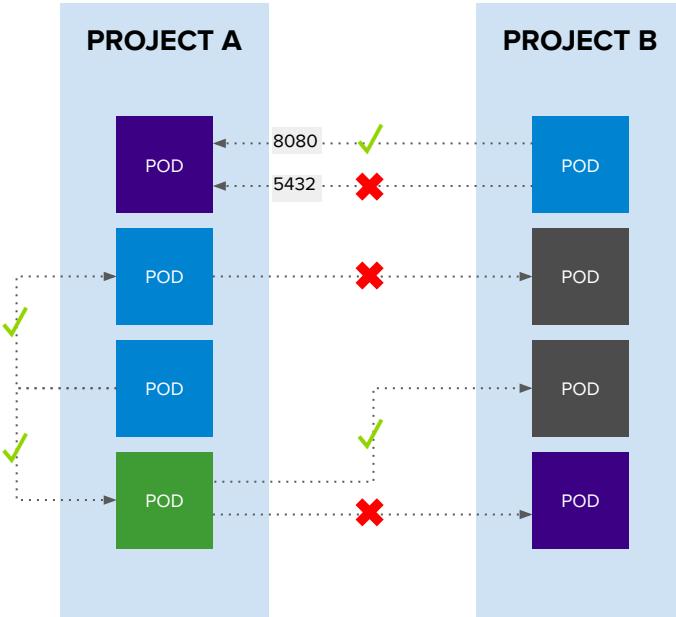

- Problem: Kubernetes only supports one network interface, "eth0", but we need:
 - Functional separation of control/data planes
 - Link aggregation for network redundancy
 - Different network protocol stacks, capabilities, SLAs
 - Traffic isolation / Network segregation and security
 - QoS
- Solution: Multus "meta plug-in" for Kubernetes CNI
- Enables multiple network interfaces per pod, each assigned a different CNI plug-in defined in pod spec
 - Each with its configuration defined in CRD objects
- SR-IOV enablement

Pod with Multus

OpenShift SDN

Network policy enabled by default

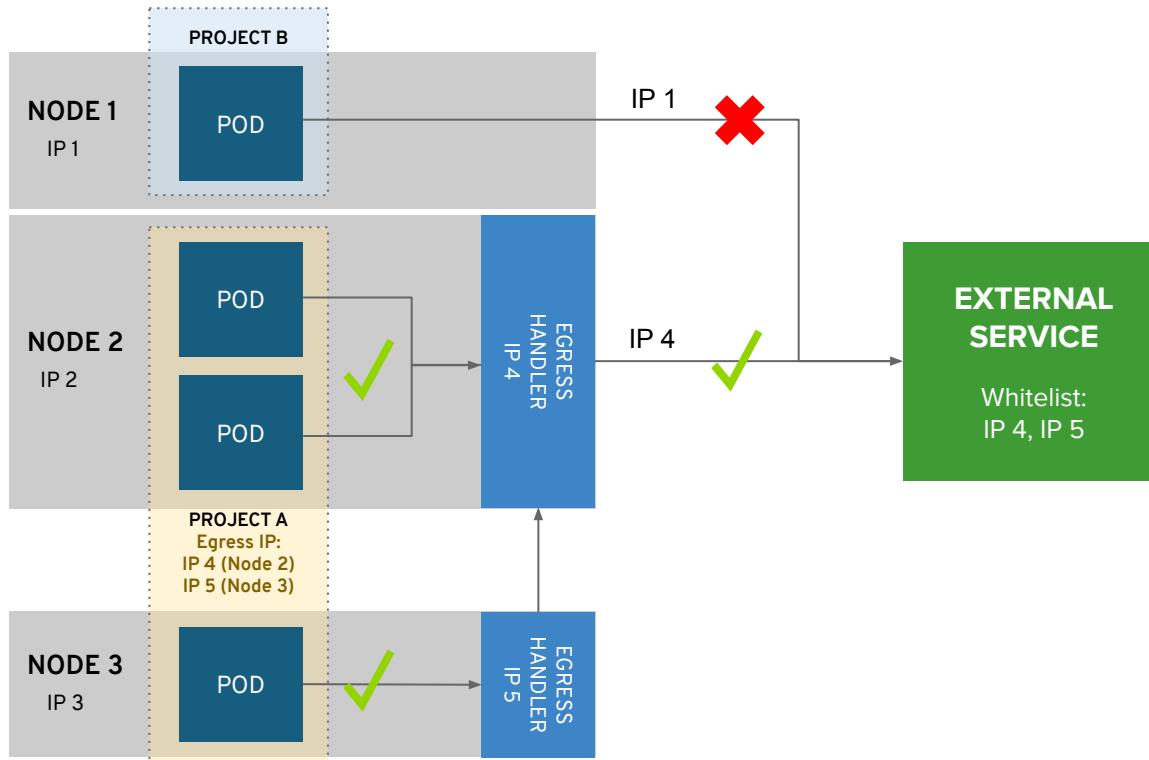

Example Policies

- Allow all traffic inside the project
- Allow traffic from green to gray
- Allow traffic to purple on 8080

```
apiVersion: extensions/v1beta1
kind: NetworkPolicy
metadata:
  name: allow-to-purple-on-8080
spec:
  podSelector:
    matchLabels:
      color: purple
  ingress:
  - ports:
    - protocol: tcp
      port: 8080
```

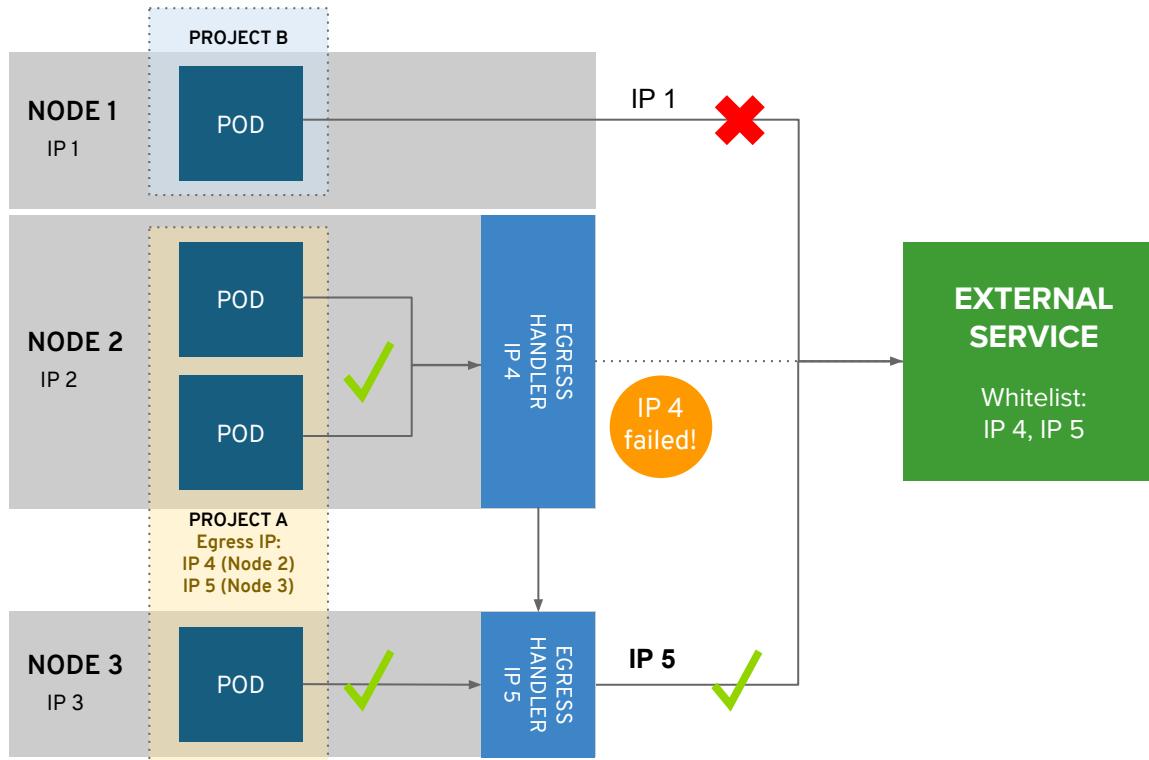

Controlling Egress Traffic

Egress IP high availability (multiple IPs)

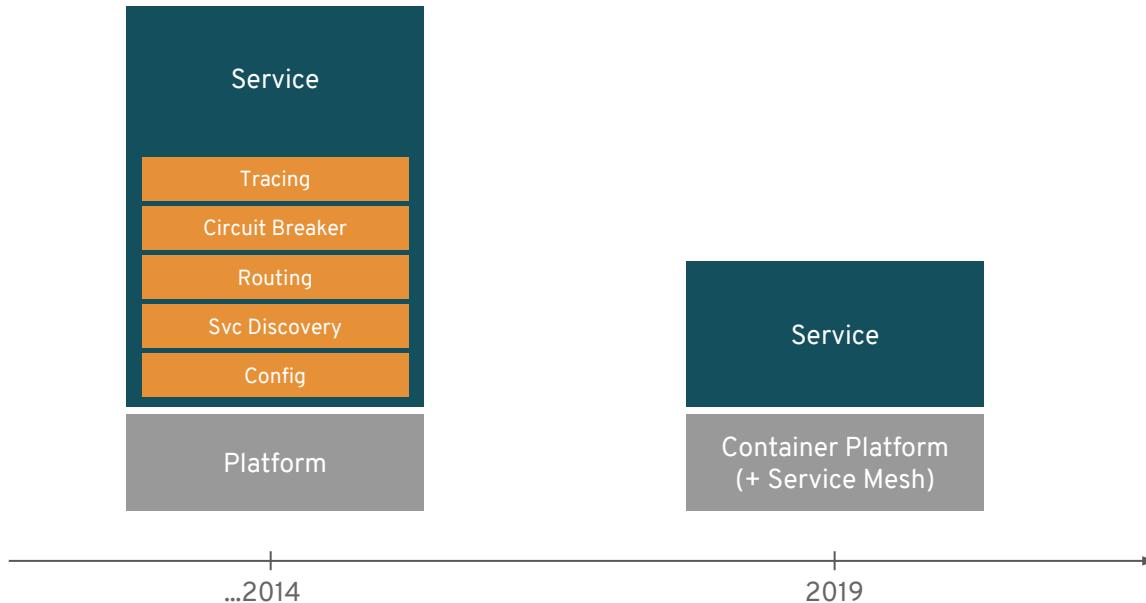

Controlling Egress Traffic

Egress IP high availability (multiple IPs)

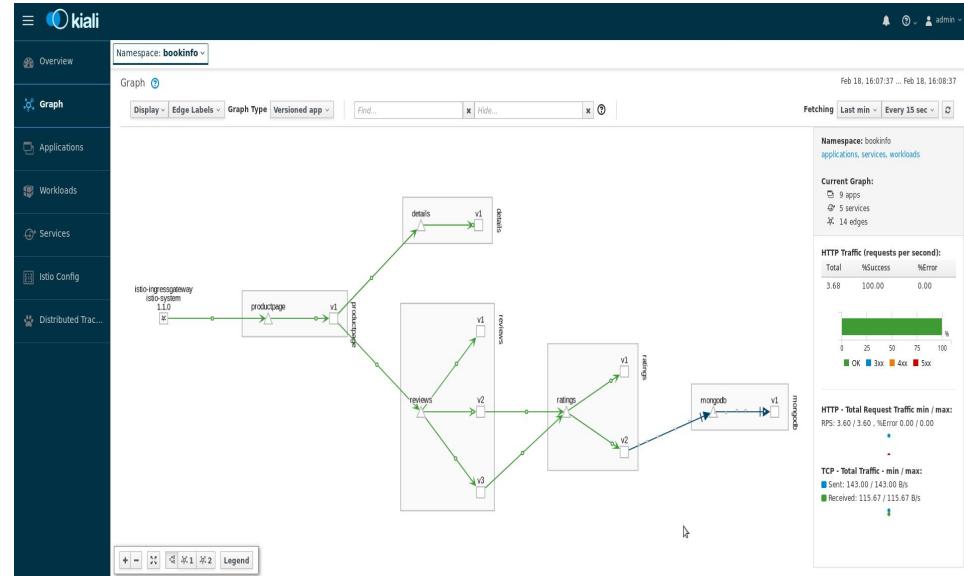

Microservices evolution

Secure microservices with Service Mesh

Key Features

- A dedicated network for service to service communications
- Observability and distributed tracing
- Policy-driven security
- Routing rules & chaos engineering
- Powerful visualization & monitoring
- Will be available via OperatorHub

Observability with Kiali

Kiali

Namespace: bookinfo

Graph

Display Edge Labels Graph Type Versioned app Find... Hide... ?

Fetching Last min Every 15 sec

Feb 18, 16:07:37 ... Feb 18, 16:08:37

Namespace: bookinfo applications, services, workloads

Current Graph:

- 9 apps
- 5 services
- 14 edges

HTTP Traffic (requests per second):

Total	%Success	%Error
3.68	100.00	0.00

OK 3xx 4xx 5xx

HTTP - Total Request Traffic min / max:
RPS: 3.60 / 3.60, %Error 0.00 / 0.00

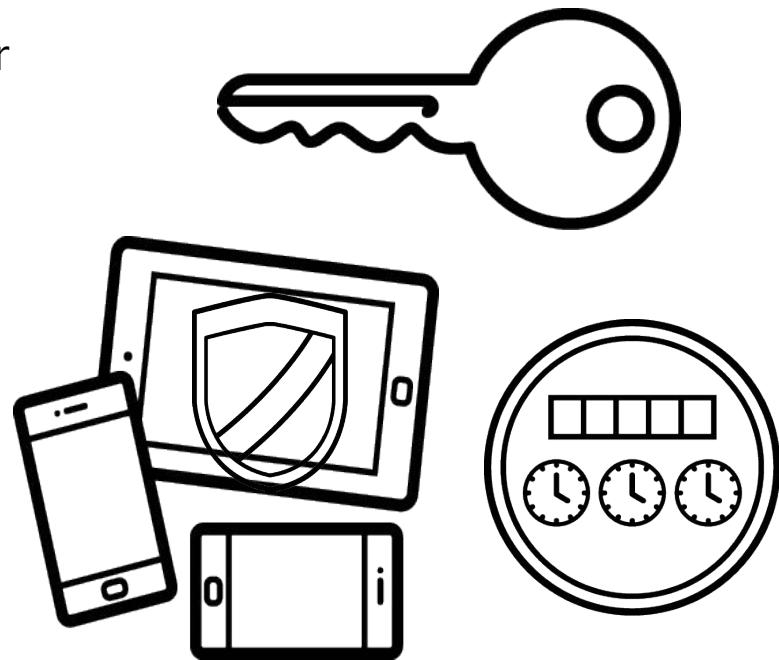

TCP - Total Traffic - min / max:
Sent: 143.00 / 143.00 B/s
Received: 115.67 / 115.67 B/s

The Kiali interface shows a service mesh graph for the 'bookinfo' namespace. The graph consists of several service components represented as boxes: 'istio-ingressgateway' (version 1.1.0), 'productpage', 'reviews', 'ratings', and 'mongodb'. These components are interconnected by a network of green arrows representing traffic flow. A legend at the bottom left indicates that green arrows represent successful requests. On the right side of the interface, there are three main sections: 'HTTP Traffic (requests per second)', 'HTTP - Total Request Traffic min / max', and 'TCP - Total Traffic - min / max'. The 'HTTP Traffic' section includes a bar chart showing 100% success rate. The 'HTTP - Total Request Traffic' section shows RPS values of 3.60 and 3.60, with 0.00% error. The 'TCP - Total Traffic' section shows sent and received traffic volumes of 143.00 B/s and 115.67 B/s respectively.

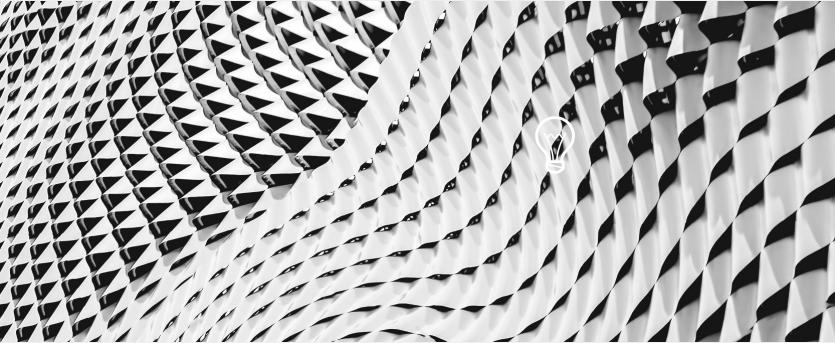

Application API management

Consider configuring an API gateway for container platform & application APIs

- Authentication and authorization
- LDAP integration
- End-point access controls
- Rate limiting

CONTROL APPLICATION SECURITY

DEVSECOPS

THROUGH THE ADOPTION OF CONTAINERS

We created Dev and Ops and Security user stories and tackled them together.

DEVELOPER

I can break builds if security and compliance rules aren't followed...

SECURITY

We're empowering the developers and ideally empowering them straight to production.

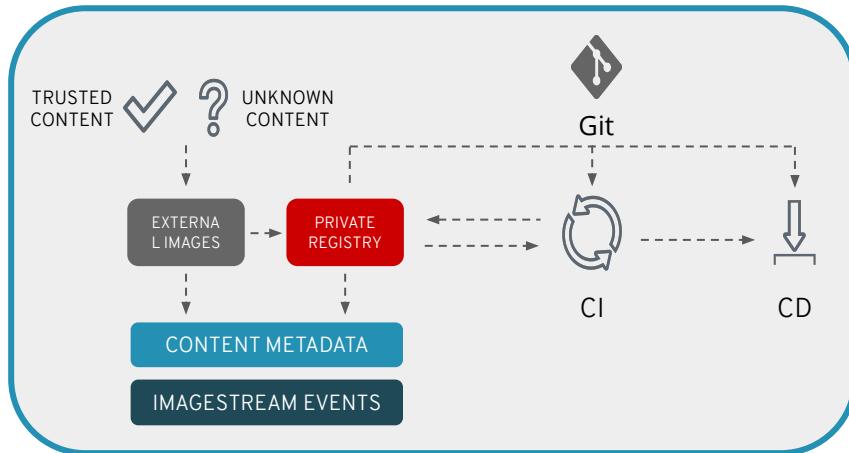

OPERATIONS

Securing Containerized Applications

An opportunity to shift security left

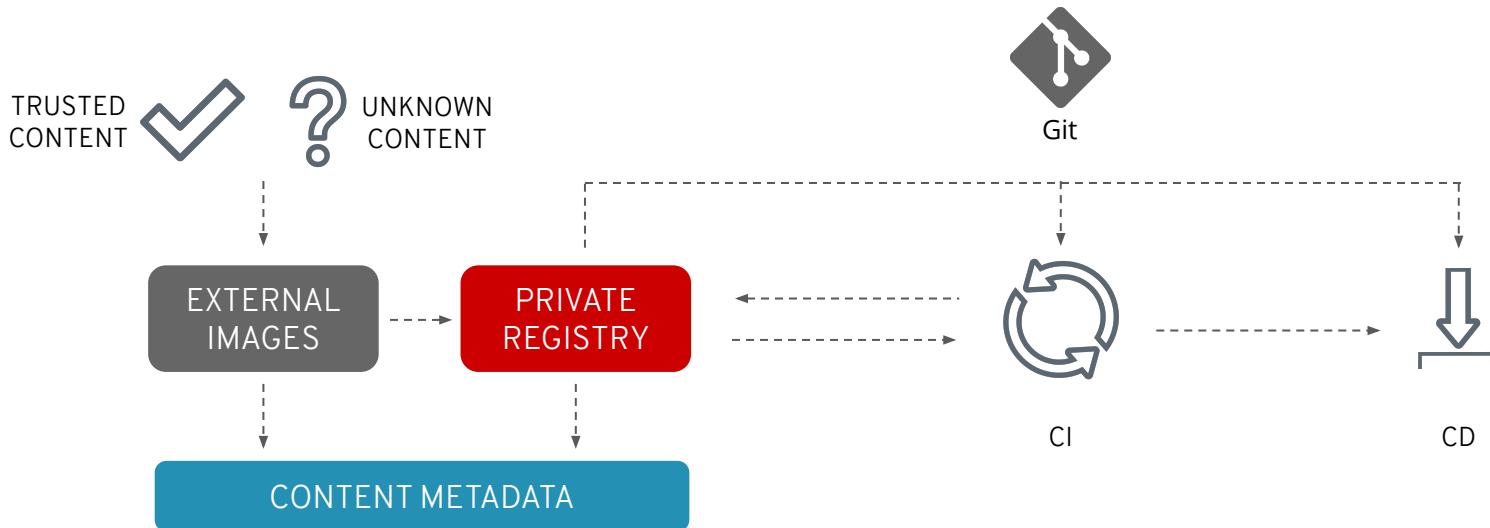

Best practices

- Use trusted sources for external content
- Use a private registry to manage images
- CI/CD must have security gates
- Application secrets management
- Apply runtime security policies
- Rebuild and redeploy - never patch a running container
- Ensure application logging, monitoring

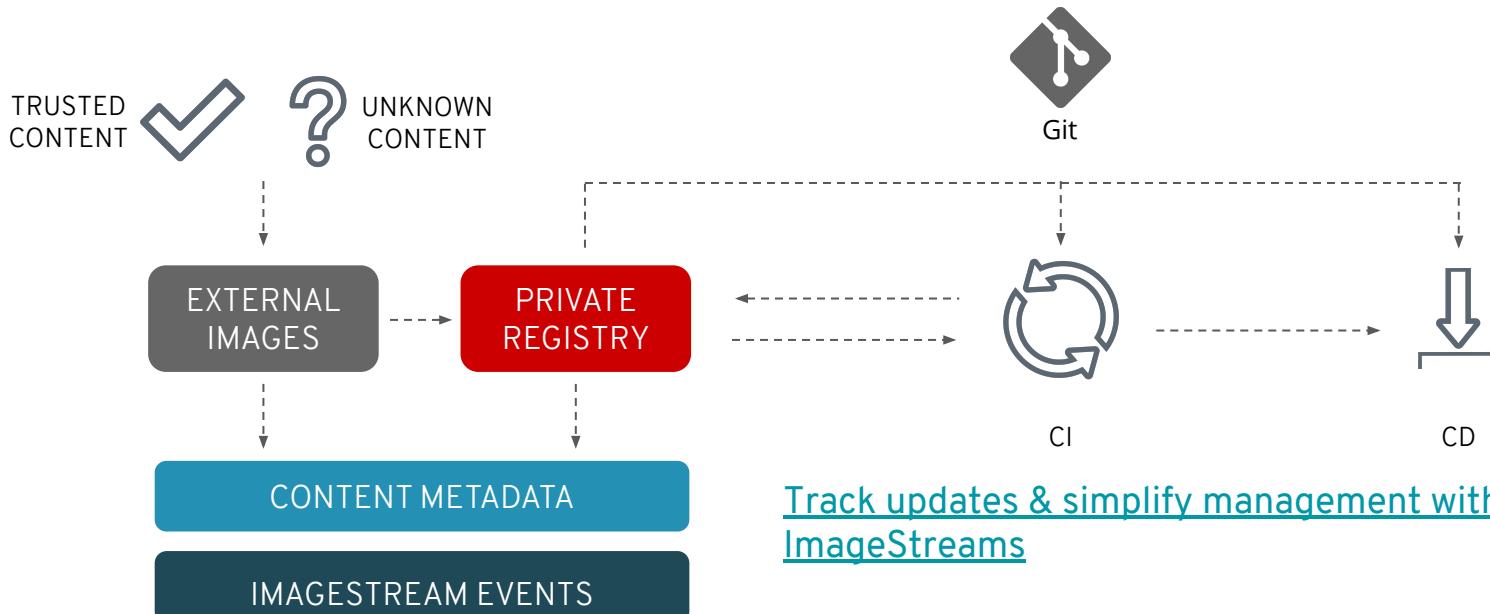

Secure & Automate The Content Lifecycle

Elements of the Openshift container pipeline

Trust is temporal: rebuild and redeploy as needed

[Track updates & simplify management with ImageStreams](#)

Use [Image Change Triggers](#) to automatically rebuild custom images with updated (patched) external images

External Content: Use Trusted Sources

Red Hat Container Images

- Signed Images
- Health Index (A to F grade)*
- Security advisories & errata (patches)

The screenshot shows the Red Hat Container Catalog interface. At the top, there is a search bar with the text "python". Below the search bar, there are navigation links: "Explore", "Get Started", and "FAQ". On the right side of the header, there are "Service Accounts" and a user icon. The main content area displays a container image entry for "rhscl/python-36-rhel7". The description reads: "Python 3.6 platform for building and running applications" by "Red Hat, Inc." in the "Product Red Hat Enterprise Linux". Below the description, there are tabs: "Overview" (selected), "Get This Image", "Tech Details", "Support", and "Tags". The "Description" section contains a detailed paragraph about Python 3.6. To the right, there is a sidebar titled "Most recent tag" with a list of tags: "Updated 6 days ago", "1-55", "Health Index A", and "Security Signed Unprivileged".

Red Hat Quay

Enterprise Container Registry

- Offered as self-managed and as-a-service
- Vulnerability Scanning (Clair)
- Geographic Replication
- Build Image Triggers
- Image Rollback with Time Machine

The screenshot shows the Red Hat Quay interface for a Python image. At the top, there are navigation links for 'RED HAT QUAY', 'EXPLORE', 'REPOSITORIES', and 'TUTORIAL'. A search bar and a user profile icon are also at the top right.

The main content area displays a circular pie chart showing the distribution of vulnerabilities:

Vulnerability Level	Percentage
High-level	7%
Medium-level	31%
Low-level	37%
Negligible-level	25%

Text on the page states: "Quay Security Scanner has detected 718 vulnerabilities. Patches are available for 144 vulnerabilities."

A legend indicates the severity levels:

- 47 High-level vulnerabilities.
- 220 Medium-level vulnerabilities.
- 177 Low-level vulnerabilities.
- 266 Negligible-level vulnerabilities.
- 8 Unknown-level vulnerabilities.

The 'Vulnerabilities' section lists 144 out of 718 detected vulnerabilities, showing details like CVE ID, Severity, Package, Current Version, and Fix Status.

CVE	SEVERITY	PACKAGE	CURRENT VERSION	FIXED IN VERSION	INTRODUCED IN LAYER
CVE-2018-15686	10 / 10	systemd	232-25+deb9u6	232-25+deb9u10	ADD file:a61c14b18252183a4719980da97ac483044bca...

CVE-2019-3462	9.3 / 10	apt	1.4.8	1.4.9	ADD file:a61c14b18252183a4719980da97ac483044bca...
CVE-2017-16997	9.3 / 10	glibc	2.24-11+deb9u3	2.24-11+deb9u4	ADD file:a61c14b18252183a4719980da97ac483044bca...

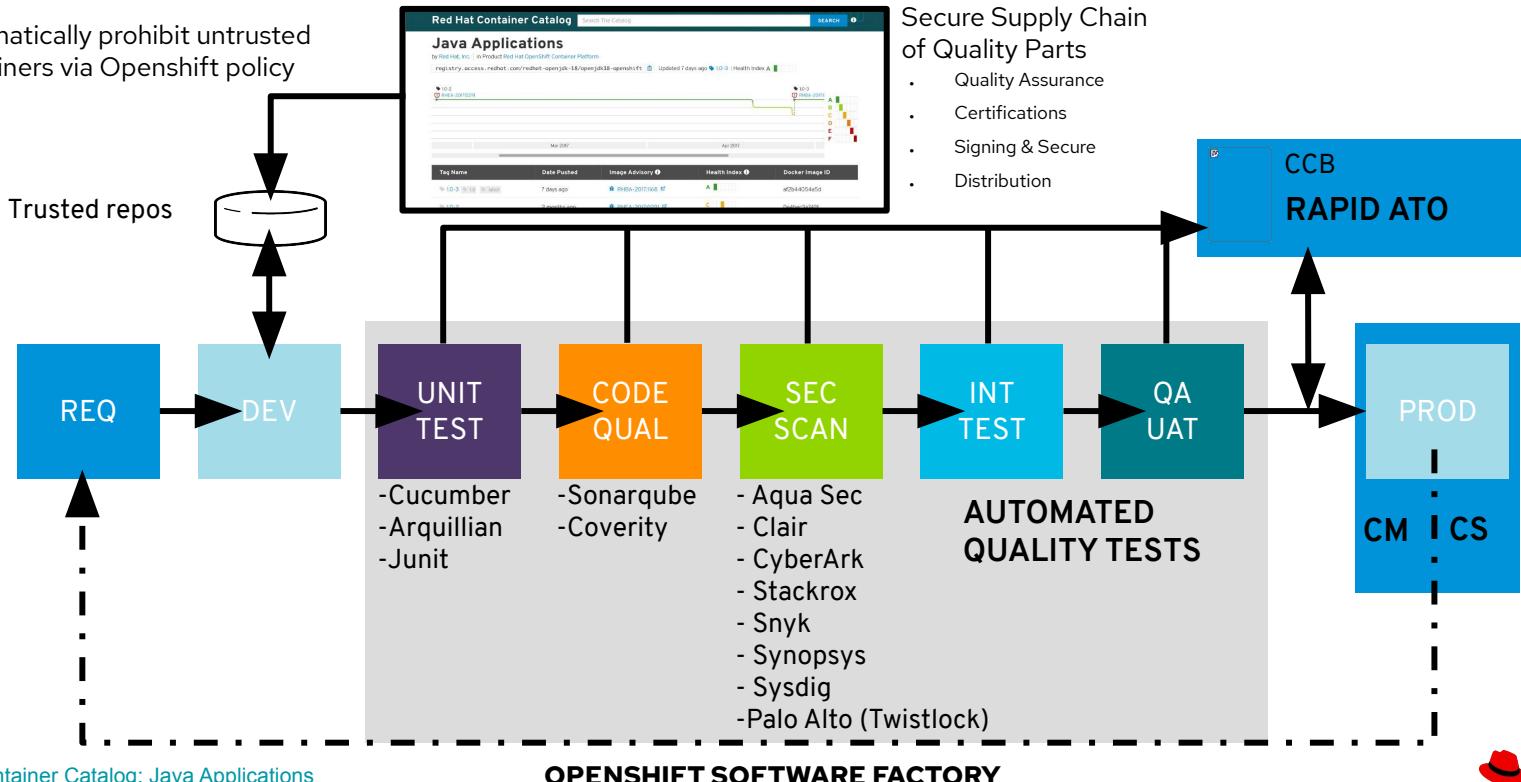

At the bottom, there are two footer sections: 'CAE-SO12-16881' and 'CAE-SO12-24585', each with a 'VDD' button.

The Red Hat logo is in the bottom right corner.

Integrate Security in your CI/CD Pipeline

Automated quality and security: because you can't inspect quality into a product

Automatically prohibit untrusted containers via Openshift policy

Enhancing Secure Application Development and DevSecOps

“Shift Left” - find CVEs and license issues during development

Red Hat Dependency Analytics IDE plugins provide security and license warnings for any project dependency:

- Be notified of CVEs in any package or sub-package
- Remediation advice (upgrade / downgrade)
- Uses open source and Snyk CVE databases
- Supported for Java, Node, Python

The screenshot shows the Red Hat Dependency Analytics IDE integrated into the Eclipse IDE interface. The left sidebar displays project files like .github, .vscode, and requirements.txt. The main workspace shows an 'requirements.txt' file with a red warning icon. A central panel titled 'Security Issues' provides details about dependencies with high common vulnerabilities and exposures (CVE) scores, mentioning a total of 3 issues found with a highest CVSS score of 7.5/10. Another panel titled 'Licenses' lists recommended licenses and conflicts. Below these are tabs for 'Direct Dependencies with Security Issues' (2) and 'Transitive Dependencies with Security Issues' (1). A table at the bottom lists dependencies by their number of CVEs and highest CVSS score, showing 'pyyaml' as the only dependency with 1 CVE and a score of 7.5/10.

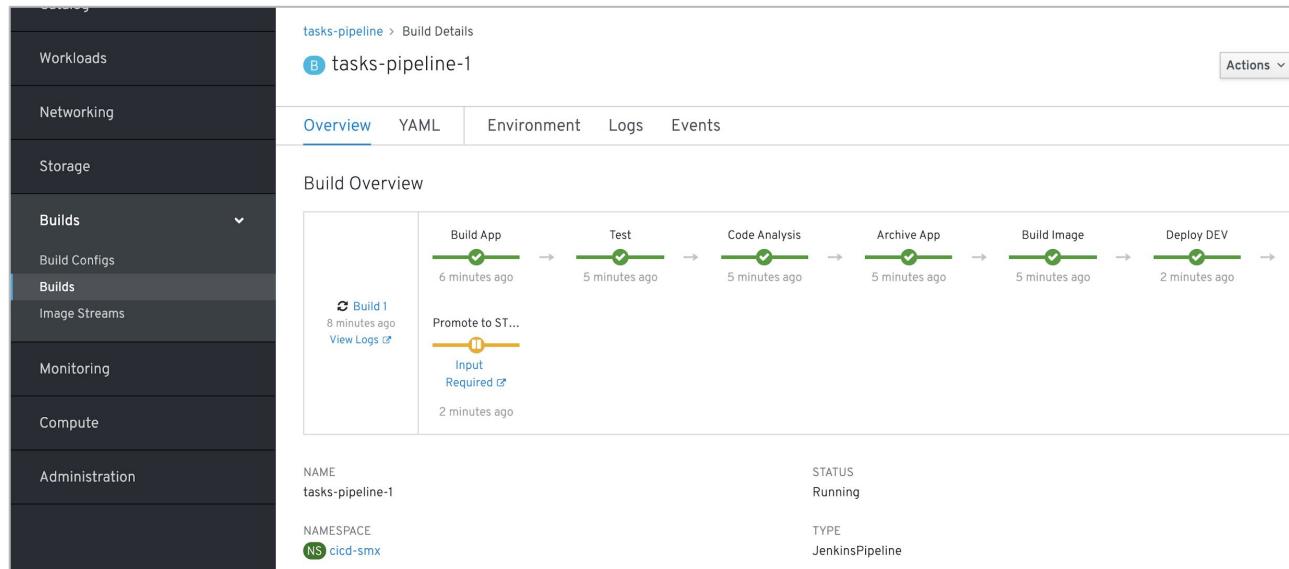

#	Dependencies	No. of CVE(s)	Highest CVSS Score
1	pyyaml	1	7.5/10

Jenkins CI/CD, run in OpenShift and deploy to OpenShift

Jenkins is still the most used CI/CD platform in enterprises and can be used from inside OpenShift.

An intuitive pipeline visualization makes it simple for users to see how builds are progressing.

The full Jenkins UI is also available.

The screenshot shows the OpenShift web console interface. On the left, there's a sidebar with categories: Workloads, Networking, Storage, Builds (selected), Build Configs, Image Streams, Monitoring, Compute, and Administration. The main area is titled "tasks-pipeline > Build Details" for "tasks-pipeline-1". It has tabs for Overview (selected), YAML, Environment, Logs, and Events. Below that is a "Build Overview" section with a horizontal timeline of pipeline stages: Build App, Test, Code Analysis, Archive App, Build Image, and Deploy DEV. Each stage has a green circle with a checkmark and a timestamp: 6 minutes ago, 5 minutes ago, 5 minutes ago, 5 minutes ago, 5 minutes ago, and 2 minutes ago respectively. A yellow bar labeled "Promote to ST..." with "Input Required" is shown between Test and Code Analysis. At the bottom, detailed information is provided: NAME: tasks-pipeline-1, STATUS: Running; and NAMESPACE: NS cicd-smx, TYPE: JenkinsPipeline.

Why? Build in, or for, OpenShift from your enterprise CI/CD system.

OpenShift Pipelines: A Kubernetes-native CI/CD platform

Provides a next-gen Kubernetes CI/CD pipeline that works for containers (including serverless).

Based on the Tekton project (which was spun out of the Knative Pipelines project) started by Google, Red Hat and others.

Target general availability in OpenShift 4.7.

$ python -c "print("Hello, world")"
Hello, world
Job succeeded

```

Why? A faster, less resource-intensive CI/CD platform that's Kubernetes-native.

Container Signing

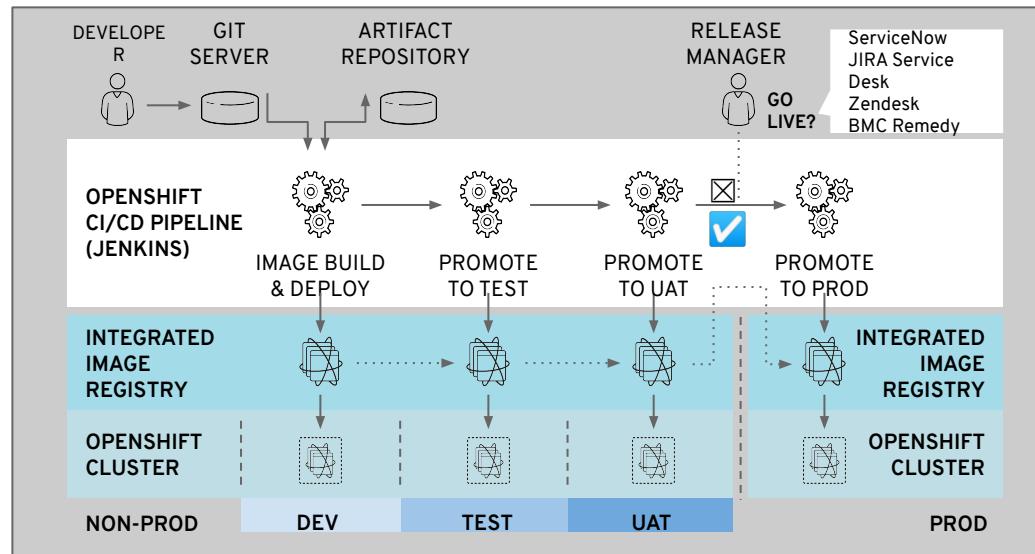

A simplified and automated approach to signing container images

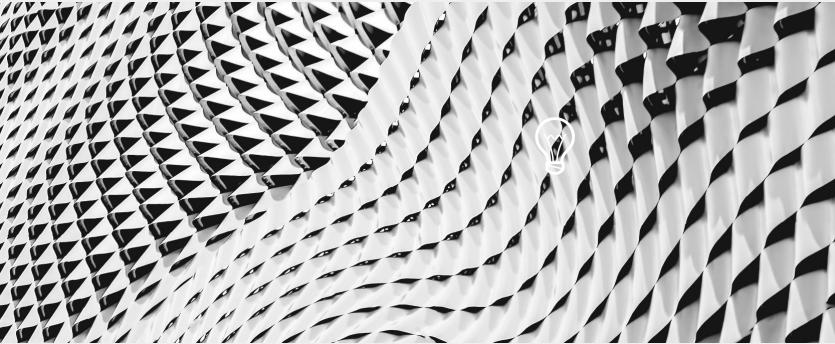

Summary

Managing container deployment

- Deployments: Containerized App Configuration as Code
- Whitelist / Blacklist external repos
- Apply runtime security policies
- Validate image signatures
- Monitor for new vulnerabilities
- Trust is temporal:
rebuild & redeploy as needed

EXTEND SECURITY

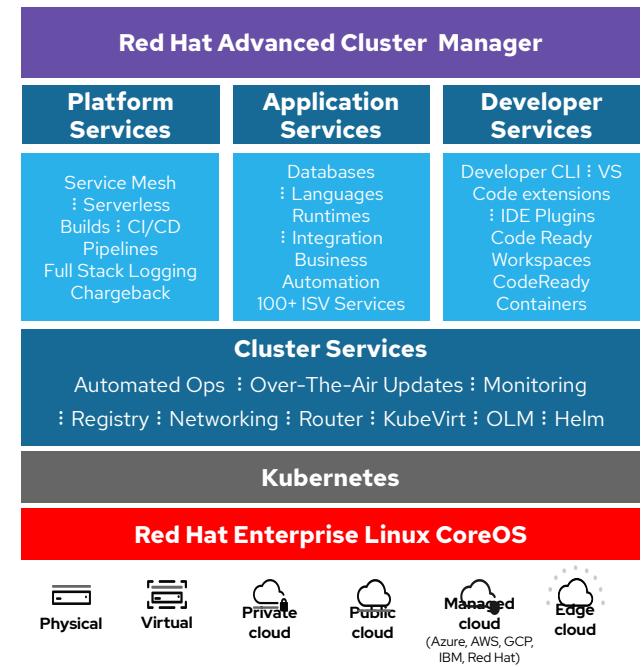

The Security Ecosystem

For enhanced security, or to meet existing policies, you may choose to integrate with enterprise security tools, such as

- Identity and Access management / Privileged Access Management
- External Certificate Authorities
- External Vaults / Key Management solutions
- Filesystem encryption tools
- Container content scanners & vulnerability management tools
- Container runtime analysis tools
- Security Information and Event Monitoring (SIEM)

Red Hat OpenShift certified operators - Security

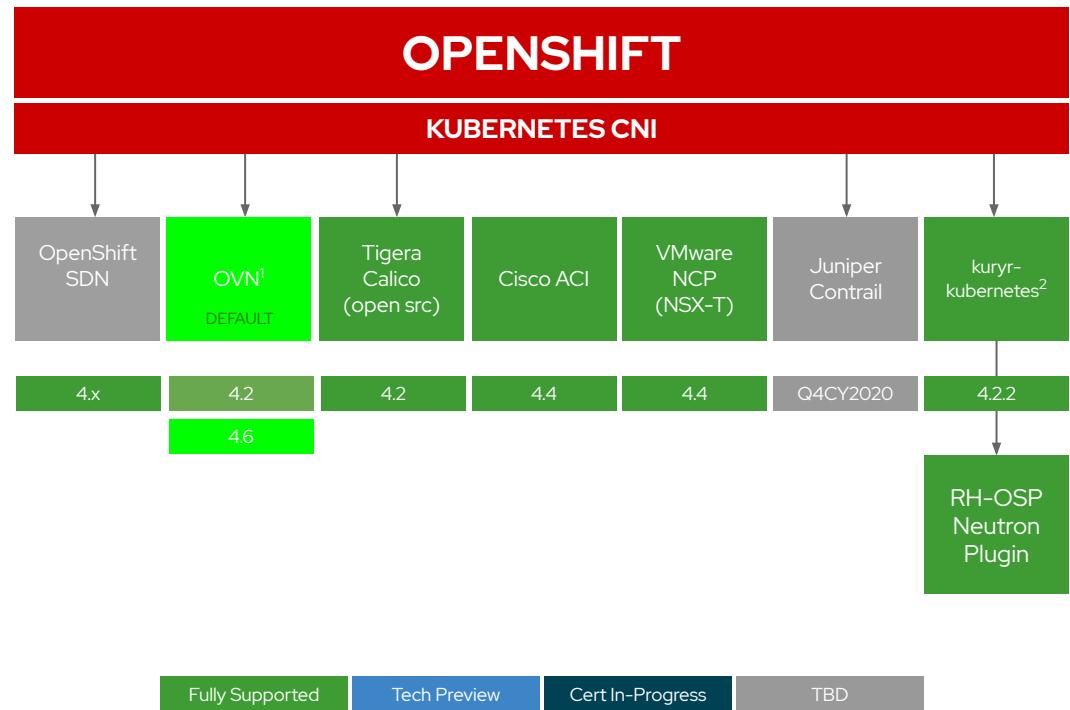

3rd-Party CNI Plug-in Certification Update

The following 3rd-party Kubernetes CNI plug-ins have begun the OpenShift certification process and are at varying stages of progress:

-  **Cisco ACI**
-  **VMware NSX-T**

The certification process primarily consists of:

1. Formalizing the partnership
2. Certifying the container(s)
3. Certifying the Operator
4. Successfully passing the same Kubernetes networking conformance tests that OpenShift uses to validate its own SDN

Red Hat

Advanced Cluster Security
for Kubernetes

StackRox | Red Hat ACS

Kubernetes is the standard
for application innovation...

- ▶ Microservices architecture
- ▶ Declarative definition
- ▶ Immutable infrastructure

...and Kubernetes-native
security is increasingly critical

- ▶ Secure supply chain
- ▶ Secure infrastructure
- ▶ Secure workloads

DevOps

DevSecOps

Security

Benefits of a Kubernetes-native approach to security

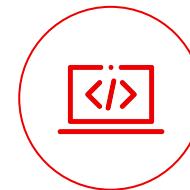

Lower operational cost

DevOps and Security teams can use a common language and source of truth

Reduce operational risk

Ensure alignment between security and infrastructure to reduce application downtime

Increase developer productivity

Leverage Kubernetes to seamlessly provide guardrails supporting developer velocity

Red Hat Advanced Cluster Security for Kubernetes

A cloud workload protection platform and cloud security posture management to enable you to “shift left”

Shift left

Secure supply chain

Extend scanning and compliance into development (DevSecOps)

Cloud security posture management (CSPM)

Secure infrastructure

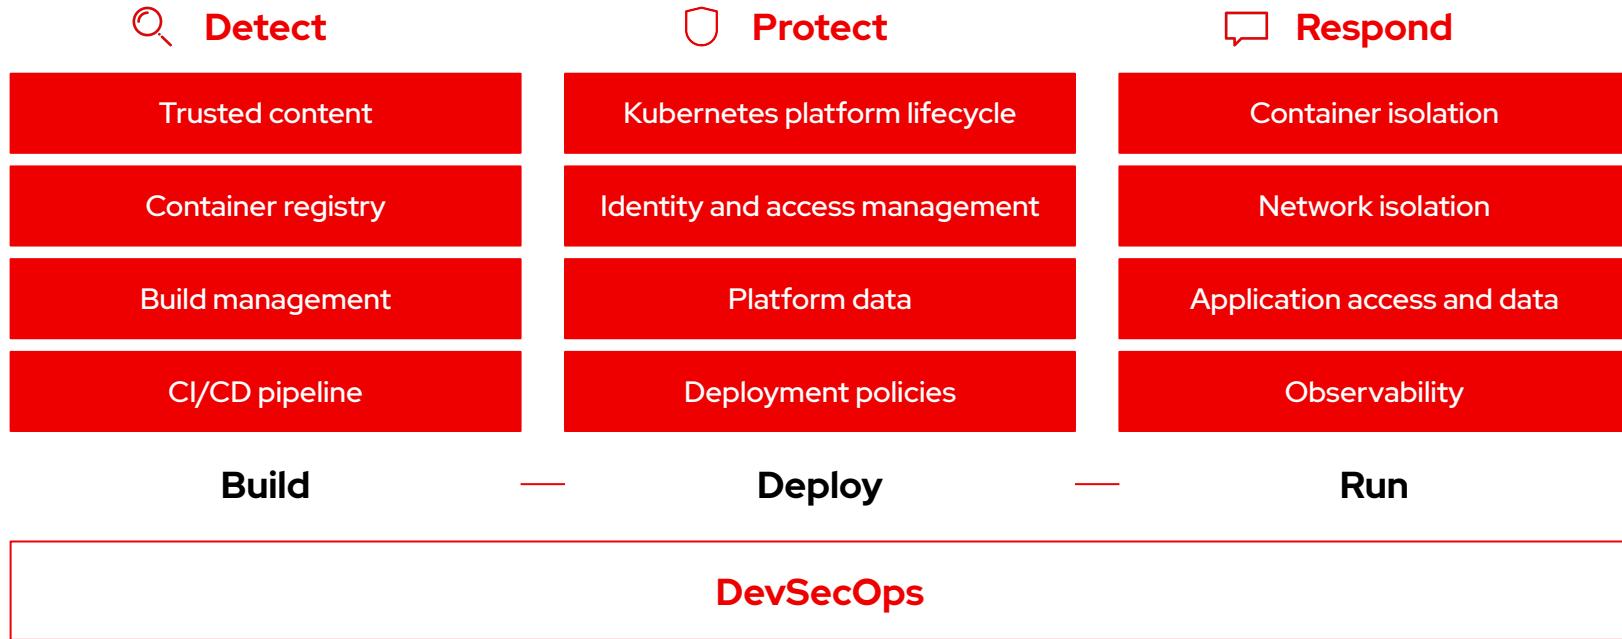

Leverage built-in Kubernetes CSPM to identify and remediate risky configurations

Cloud workload protection (CWPP)

Secure workloads

Maintain and enforce a “zero-trust execution” approach to workload protection

Red Hat OpenShift provides a secure foundation

RHACS delivers security depth to entire application lifecycle

Detect

Trusted content
Container registry
Build management
CI/CD pipeline

Protect

Kubernetes platform lifecycle
Identity and access management
Platform data
Deployment policies

Respond

Container isolation
Network isolation
Application access and data
Observability

Vulnerability analysis
App config analysis
APIs for CI/CD integrations

Image assurance and policy admission controller
Compliance assessments
Risk profiling

Runtime behavioral analysis
Auto-suggest network policies
Threat detection / incident response

Build

Deploy

Run

DevSecOps

RHACS

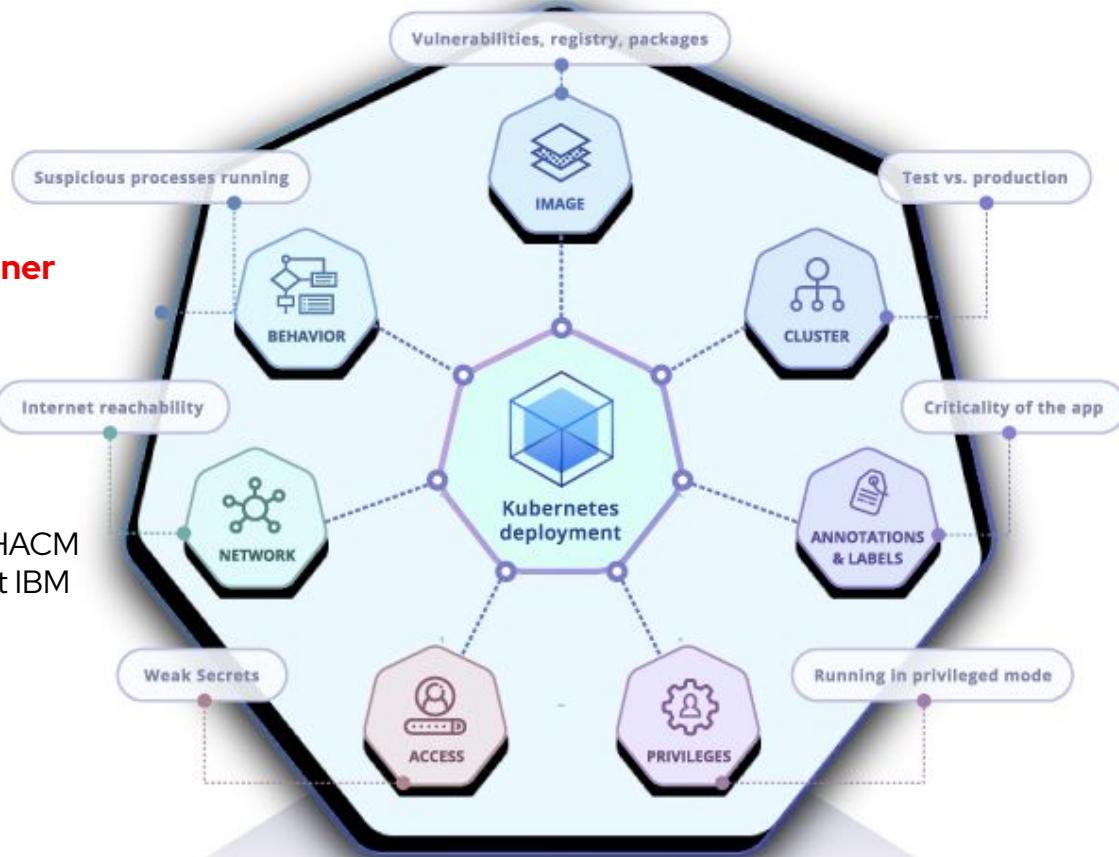

Securing Kubernetes Deployments

It's all about the Application in the container

- plus a Registry Scanner.

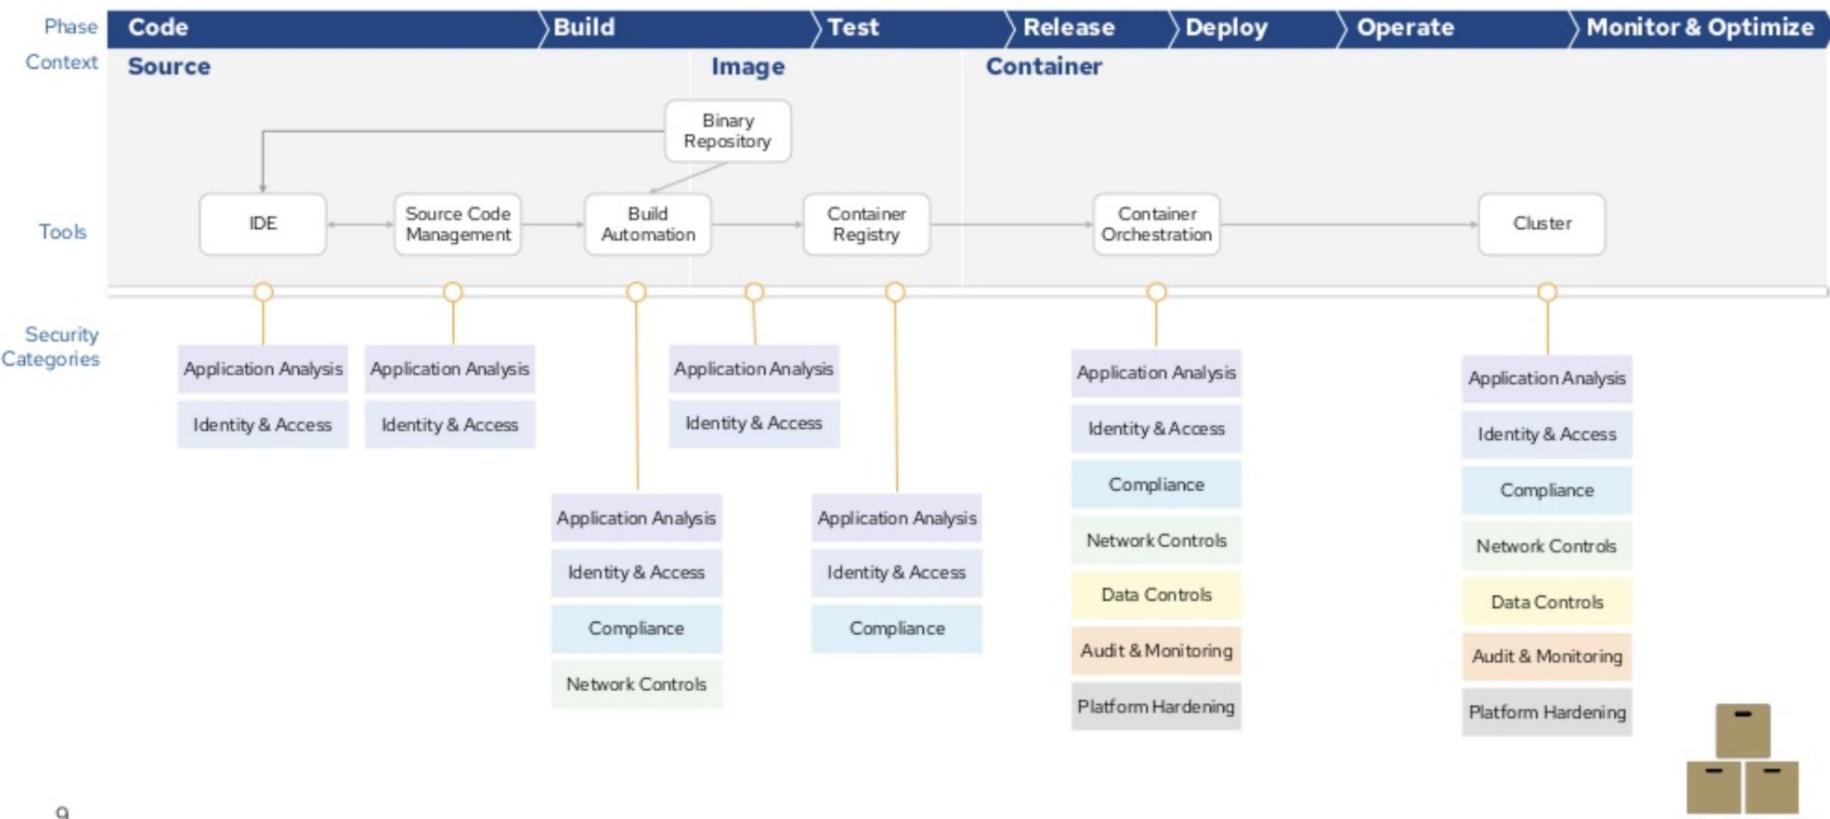

It's not:

- End 2 End Monitoring -> Dynatrace
- Infrastructure Monitoring - RHACM
- Infrastructure Compliance Monitoring - RHACM
- Access Control / Audit to and in OpenShift IBM QRadar or CyberARC
- SIEM Solution -> Splunk
- Certificate Management - Cert Manager
- API Management - 3scale
- Application Performance Management
- Registry - QUAY
- Service MESH

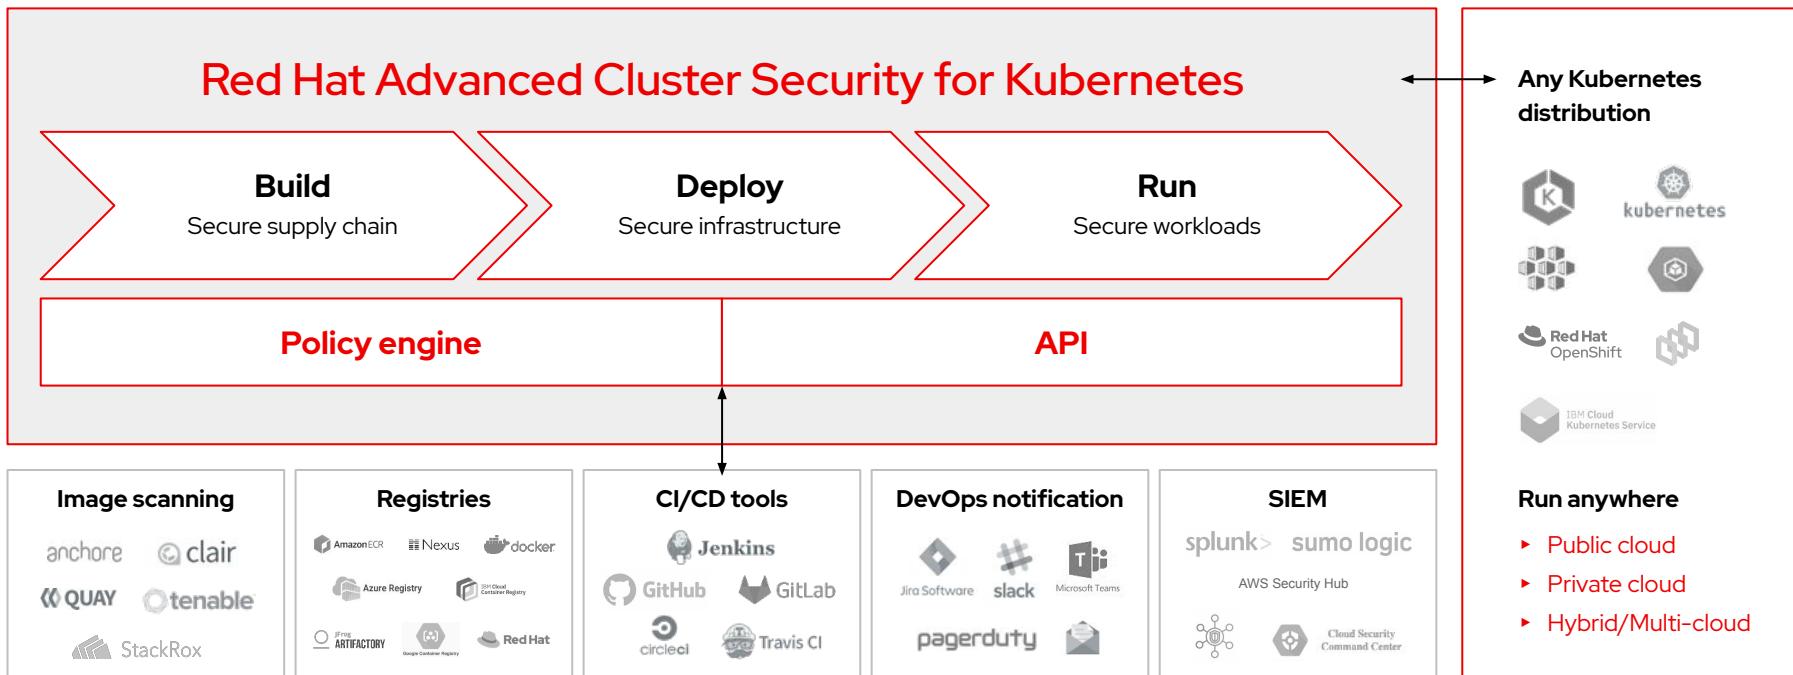

RHACS

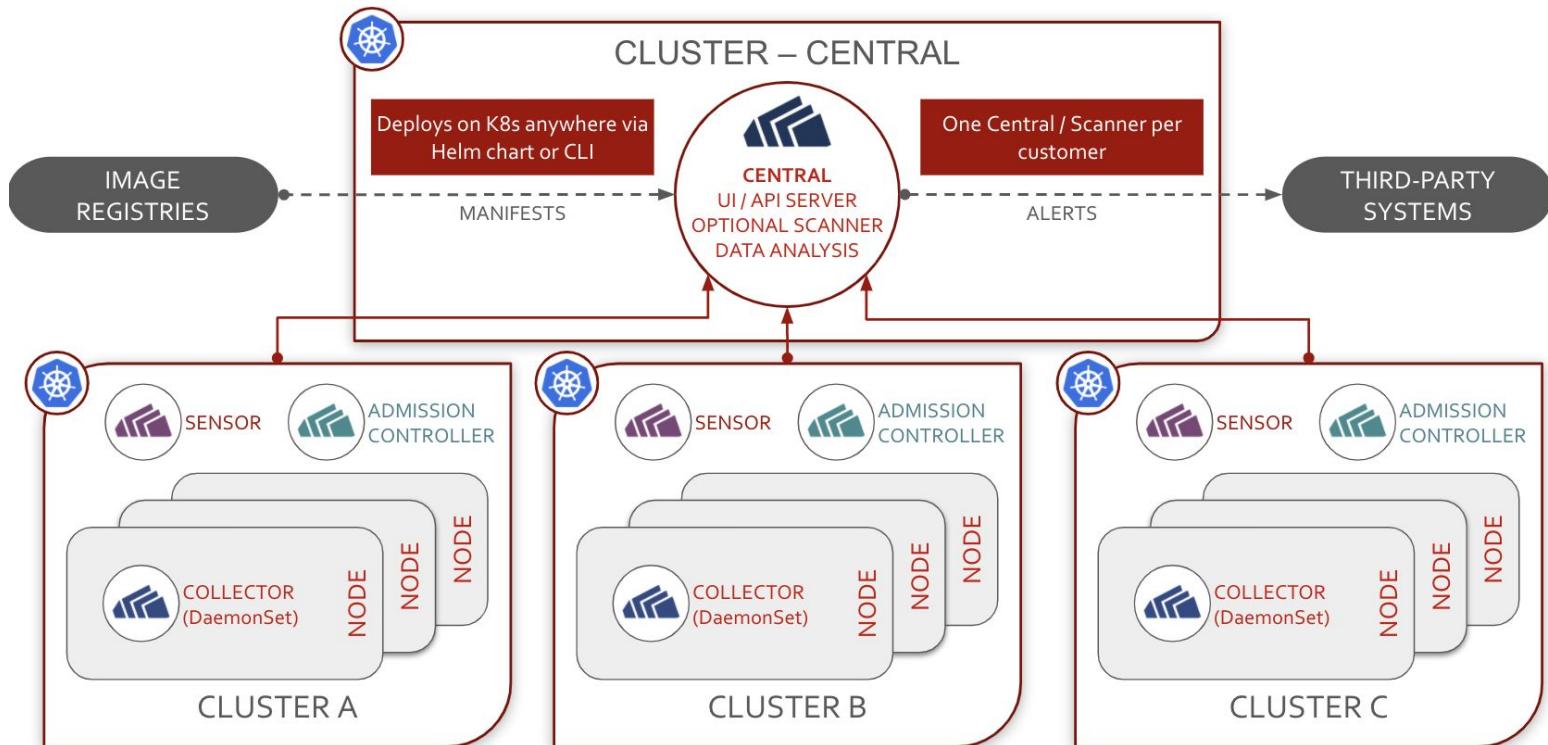

adding security to dev ops for your kubernetes native applications

The first Kubernetes-native security platform

Architecture

Thank you

Red Hat is the world's leading provider of enterprise open source software solutions. Award-winning support, training, and consulting services make Red Hat a trusted adviser to the Fortune 500.
